LEGEND
LITHOLOGY
TERTIARY
4 Basalt; olive green dykes and flat-lying flows.
3 Quartz-Feldspar Porphyry; dykes of granite(?) composition, which may be part of the Coryell Intrusions.
CRETACEOUS(?)
NELSON PLUTONIC ROCKS
2 Granodiorite to Diorite; massive, medium to coarse grained with more mafic-rich border zones and local moderate to strong sericite alteration.
UPPER TRIASSIC
NICOLA GROUP
Ig Skarn; massive, coarse grained, predominantly red-brown garnet with pyroxene and local minor epidote, calcite, magnetite and hematite. Light coloured, fine grained, banded, calc-silicate hornfels is often interbedded. Skarn hosts local disseminated and massive sulphides.
Ic Marble; light to dark grey, locally fossiliferous, poorly preserved bedding, strongly fractured with abundant white calcite veinlets.
Is Siltstone; black calcareous to siliceous (hornfels) with local chert pebble conglomerate, heterolithic slump breccia and greywacke. Often interbedded with Iv and Ic.
Iv Andesite to Basalt; dark green, massive to weakly flow banded, finely to coarsely crystalline with abundant feldspar and augite phenocrysts. Commonly strongly sheared and chlorite altered.
SYMBOLS
Geological Contact; known, inferred
Bedding with dip angle
Outcrop; known, approximate
Massive Sulphide skarn, predominantly pyrite and pyrrhotite with local arsenopyrite, chalcopyrite, sphalerite and gold values
