1. INTRODUCTION

This report is a compilation of data obtained during a diamond drill program undertaken through the period, November 5, 1979 - January 17, 1980 on Dimac Resource Corp.'s Gotcha Tungsten Property. A total of 20 BQ diamond drill holes were completed during this program. Total metres drilled were 544 (1799 ft.).

The drill holes were closely spaced and confined to a small open pit area located on the boundary of the Gotcha and Gotcha 2 claims. The location of the pit and drill holes is shown on Figure 2 and Map 1. Map 2 is included in this report only to show the pit's position relative to surveyed topography. The purpose of the drill program was to drill prove reserves indicated possible by previous work.

Financial assistance was provided by the BCDM in the form of MEIP Contract #46.

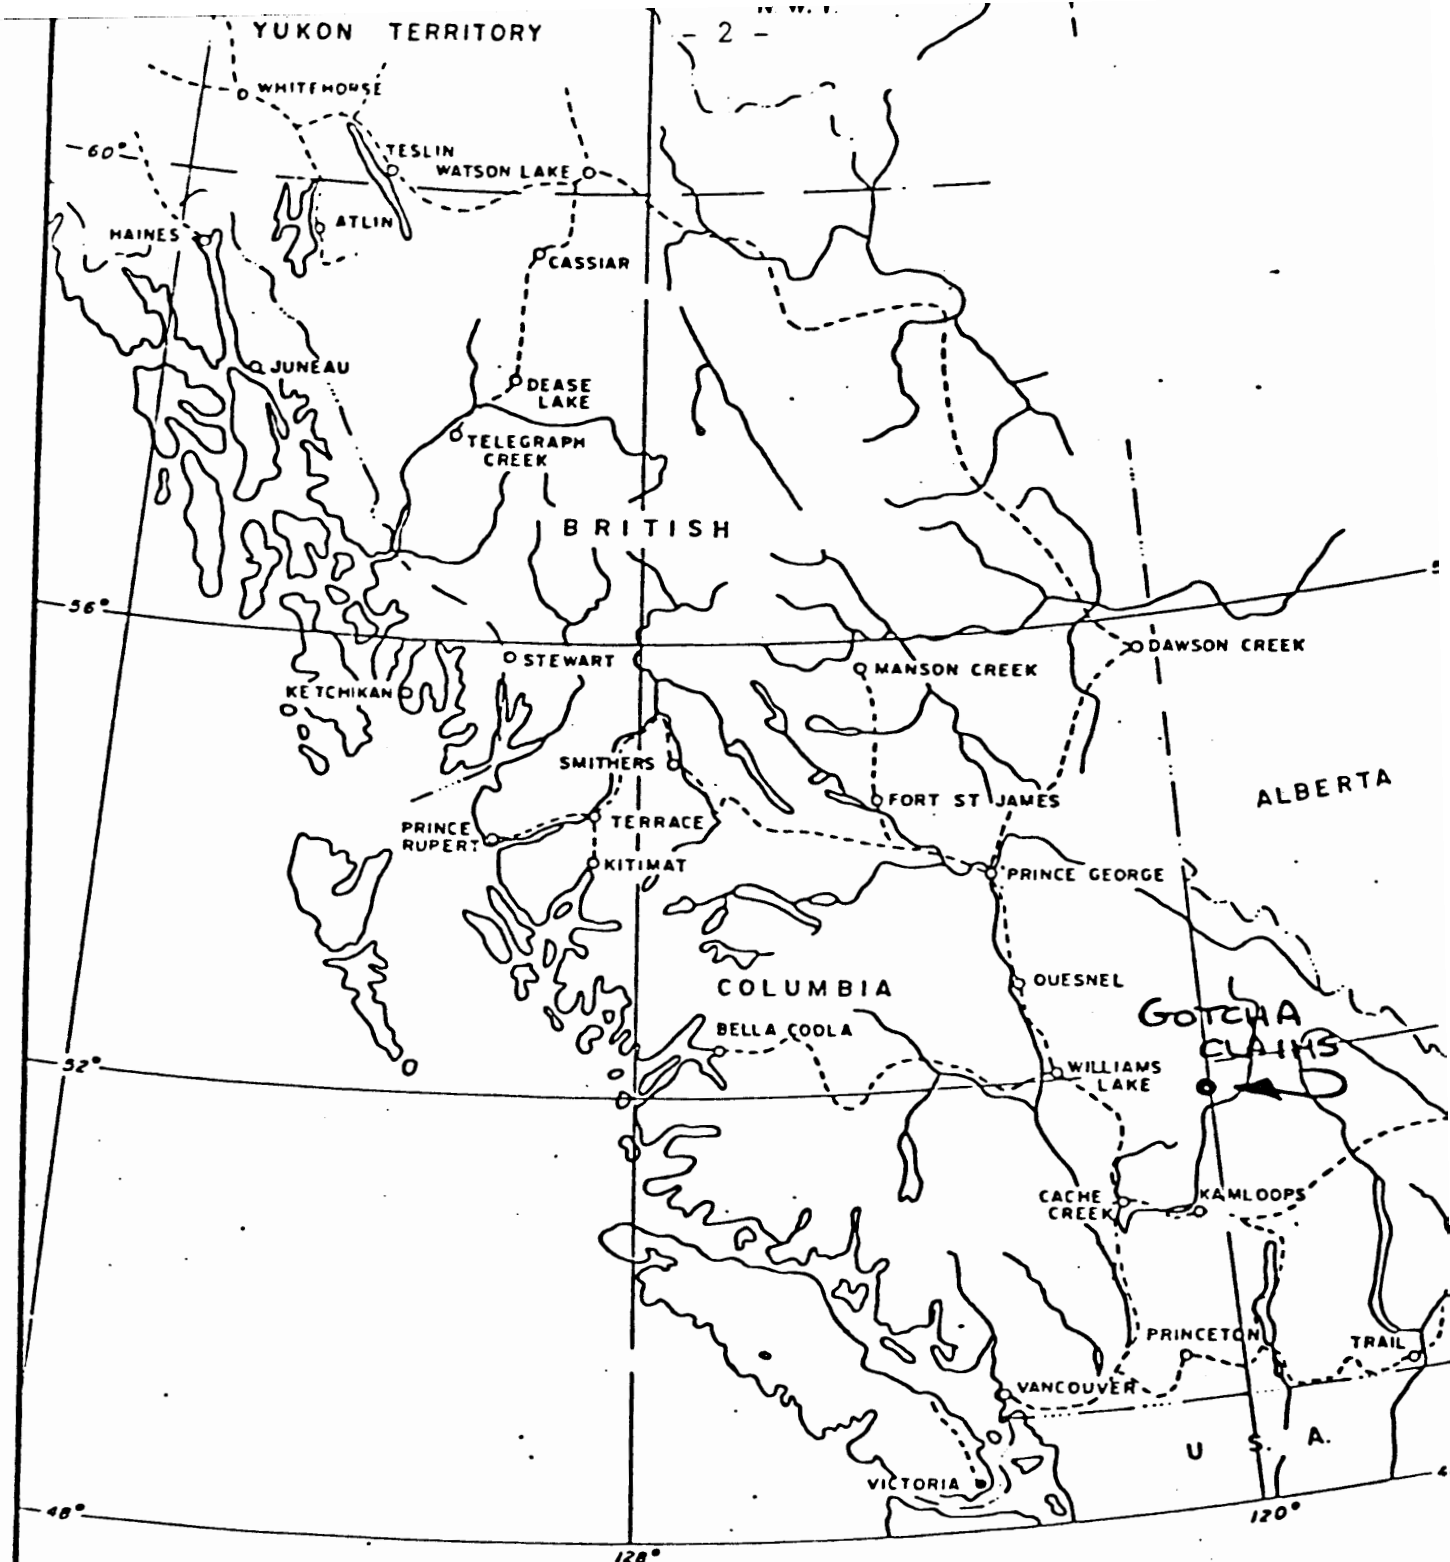

2. OWNERSHIP

The Gotcha claim group is owned by Dimac Resource Corp. and consists of:

<u>Claim</u>	<u>Record No.</u>	<u>No. of Units</u>
Gotcha	881	1
Gotcha 2	786	9
Gotcha 3	1927	9

3. LOCATION, ACCESS & TOPOGRAPHY

The Gotcha claims are located 20 miles northeast of Clearwater, British Columbia and are within the Kamloops Mining Division (see Figure 1). More specifically, the claims are 2 miles up Maxwell Creek from its junction with Raft River, on the west

bank of the creek, at an elevation of about 3,750 ft. The claim group is covered by the Raft River map 82M/13E of the 1:50,000 topographic series and by the northwest corner of the Geological Survey of Canada map 48.1963 Adams Lake 82M/W.

A well maintained logging road along the west bank of Raft River and Maxwell Creek provides access to the property. This road adjoins the Yellowhead Highway (Route 5) 4 miles east of Clearwater.

The claims are located on the thickly vegetated west side of the valley which in the area of the claims is sloping at 20° to 45° towards Maxwell Creek.

4. REGIONAL GEOLOGY

The claim group lies within the Omineca Crystalline Belt which is the high grade metamorphic core zone of the Eastern Cordilleran Fold Belt. Rocks in the zone have generally been metamorphosed to upper amphibolite facies and have experienced multiple phases of intense penetrative deformation. The deformation and metamorphism were probably completed by late Jurassic to early Cretaceous times but the stratigraphic age of some of the metasediments is at least 1500 m.yr. Large volumes of "granitic" rock were intruded into the belt during and after the protracted metamorphism and deformation.

The property covers an area of contact between the metasediments and a post metamorphic stock. The metasediments may correlate with the Lower Paleozoic, quartzite, limestone assemblage of the Kootenay Arc to the southwest, though such a correlation is extremely tenuous. The stock may be late Cretaceous or early Tertiary in age based on a single muscovite

potassium-argon age of 64 m.yr. from a phase of the stock.

5. GENERAL GEOLOGY OF THE PROPERTY

a) Previous Work

The property was first found in July 1972 by Union Carbide as a result of a regional stream sampling program. Silts in Maxwell Creek at its confluence with Raft River have anomalously high scheelite content; the anomaly can be traced back up the creek to scheelite bearing boulders in the creek below the present pit. UNION Carbide worked on the property from 1972 to 1974 and called it the Boulder Group. In the summer of 1972 preliminary trenching exposed mineralized skarn and geological mapping revealed the presence of two skarn bands. Diamond drilling of holes 1, 2, 3, 4, 5, 6 & 7 (total length 1,769.3 ft./534 m.) was completed in the winter of 1972/1973. The next summer further mapping and trenching took place. Also a soil sampling grid (7000 ft./2112.9 m. x 4000 ft./1207.4 m., sample spacing 200 ft./604 m.) was established over the property and surrounding ground. Soil samples were collected and panned for scheelite but no major anomalies other than those previously identified in the vicinity of the pit were found. In the winter of 1973/1974 diamond drill holes 8, 9 and 10 were drilled (total length 1,436 ft./433 m.).

The property was restaked by United Mineral Services Ltd. in 1977 who extended some of the trenches and exposed more mineralization. N.C.A. Mineral Corp. optioned the property in 1977 and in January 1978 drilled 18 percussion holes (total length 950 ft./287 m.) before the option was terminated. In 1978 a pit was opened up and about 1500 tons (1364 tonnes) of about 1.5% scheelite ore mined. The pit area was surveyed during July 1979 by Dr. Barry Ryan.

Dimac Resource Corp., a subsidiary of United Mineral Services took over the property and carried out the drill program which is the subject of this report.

b) Rock Types

Most of the outcrop in the area occurs in the pit or in the walls of the trenches. In the rest of the area bedrock is covered by up to 50 feet of till. Outcrops of metasediments, skarns and quartz monzonites. Five main rock types have been identified (1) medium grained biotite-quartz monzonite; (2) medium to coarse grained alaskite or muscovite granite; (3) biotite schist; (4) biotite quartzite; (5) skarn or calc-silicate.

Medium grained, biotite-quartz monzonite - Quartz monzonite outcrops extensively on the access road to the pit as an orange to brown weathering moderately well fractured rock containing no macroscopic fabric. In detail the quartz monzonite is a medium grained, equigranular, biotite (5 to 15%) quartz monzonite. The biotite does not outline a foliation and the rock generally has a very uniform appearance; veins of pegmatite or xenoliths of metasediments are rare. Contacts of quartz monzonite with the metasediments generally appear to be conformable.

Alaskite - Outcrops of alaskite occur in the pit and adjacent to the pit. In the pit fresh boulders are massive and chalky white. The grain size of the alaskite varies from medium to coarse, and the texture is generally equigranular but in places graphitic. Quartz makes up about 60% of the rock, most of the rest is composed of equal proportions of plagioclase and K-feldspar, no mafic minerals are present and muscovite (sericite?) is present in amounts up to 5%. There is no fabric to the rock except for occasional quartz stringers and pegmatite

veins. The upper contact of alaskite with skarn is locally discordant and interfingered by skarn, but over a distance of 60 metres seems to be approximately concordant. There is no distinct border phase, though the upper part of the alaskite may be mixed with a considerable amount of skarn. The lower contact of alaskite with skarn appears to be fairly distinct and concordant.

The alaskite does not extend northwest of the pit and outcrops southeast of the pit along strike are pegmatitic and contain a considerable amount of metasedimentary material.

Muscovite separated from the alaskite has a K-Ar model age of 64 m.yr. +/- 2 m.yr.

Schist - Outcrops of brown weathering, medium banded, well foliated schist account for about 20% of the exposed rock. The schist is medium grained and contains 40% quartz, 20% feldspar and 20% biotite. More exotic minerals are absent and the only major variation from this sample mineralogy is the appearance of large disoriented flakes of sericite in the schist near contacts with the alaskite or quartz monzonite. The schist grades to biotite quartzite with increase in quartz content.

Biotite Quartzite - This rock type forms massive to medium banded, brown weathering outcrops that account for about 10% of the exposed rock. In appearance the quartzite is similar to the schist but banding is coarser and foliation is absent.

Skarn or Calc-silicate - calc-silicate rocks and skarns derived from them, make up about 30% of the exposed rock. Outcrops of calc-silicate have a distinctive grey, pitted surface if the

rock contains significant amounts of calcite or are grey-green and coarse banded if the amount of silica is high. Calc-silicate adjacent to alaskite or quartz monzonite is converted to skarn of which there are 3 major types; types (1) and (3) are scheelite bearing.

- 1) Quartz-garnet (grossularite?)-idocrase skarn
- 2) Wollastonite-garnet-calcite skarn
- 3) Diopside-quartz skarn

Quartz-garnet-idocrase skarn forms massive, rough surfaced, brown outcrops with indistinct layering. In hand specimen it is coarse to very coarse grained containing from 10 to 50% idocrase, 10 to 50% garnet and 10 to 50% quartz. Garnet occurs as clusters of euhedral, medium grained crystals or as coarse grained, subhedral crystals. Often there appears to be two generations of garnets with the subhedral crystals belonging to the earlier generation. Idocrase forms coarse grained, sub-euhedral crystals. Quartz forms a coarse grained matrix to these two mafic minerals.

Wollastonite-garnet-calcite skarn forms chalky white, rough surfaced outcrops. Garnet which makes up 5 to 20% of the rock occurs as medium grained, equigranular crystals clustered together in 1 to 5 cm. diameter masses. Wollastonite forms radiating masses growing outward from the garnet masses. Calcite occurs as medium to coarse grained masses often outlining the indistinct layering.

Diopside-quartz skarn forms massive to medium banded, grey to greenish outcrops. The fine grained nature of the skarn precludes a detailed description of its mineralogy but it certainly contains a high proportion of diopside and probably other minerals such as actinolite and epidote. Fresh samples are dark green to black, medium to fine grained and fine to medium banded.

In the vicinity of the pit, the skarn derived from the calc-silicate forms 5 major bands. Three of these bands contain economic quantities of scheelite mineralization.

c) Metamorphism and Skarn Formation

The rock types have been affected by regional metamorphism of upper amphibolite grade that probably finished by late Jurassic time; by contact metamorphism, caused by intrusion of the quartz monzonite, and possibly at about the same time by metasomatism originating from the alaskite. The contact metamorphism and metasomatism probably occurred 64 m.yr. ago, long after the deformation and regional metamorphism had ceased.

It is difficult to distinguish between the effects of contact metamorphism and metasomatism but in the pit area a sequence of metasomatic changes can tentatively be identified. The quartz-garnet-idocrase skarn seems to be the end result of metasomatism involved introduction of iron and crystallization of garnet probably grossularite. The second stage saw introduction of silica and crystallization of wollastonite. This was followed by continued introduction of silica and crystallization of idocrase and garnet possibly at the expense of wollastonite. The final stage was represented by silica flooding and introduction of tungsten which crystallized as scheelite (powellite has not been observed).

The diopside-quartz skarn apparently has not experienced the same degree of metasomatism though there are vuggy zones in which patches of coarse calcite and idocrase crystals occur. Scheelite seems to be concentrated in these zones but also occurs as coarse grained poikilotic crystals enclosing diopside, scattered through the rock.

6. DRILL HOLE DATA

The following compilation shows pertinent data for the twenty holes drilled. The hole locations are shown on Map 1 in relation to the prominent ~~pit~~ located on the property.

7. DRILL HOLE LOGS AND ASSAY RESULTS

Field drill logs are presented in this section complete with WO₃ assays made. A total of 118 assays for WO₃ were made on split core sections by Chemex Labs of North Vancouver. All drill core is stored at Dutch Lake Resort, Clearwater, B.C.

8. EXPENDITURE STATEMENT

The total cost of the drill program was \$50,492.07. This expenditure is supported by invoices included in this section and can be allocated as follows:

Drilling

Drill contractors	\$41,626.10	
Core storage	87.79	
Vehicles & water truck	3,863.05	
Room & board	1,171.85	
Supervision	1,109.13	
Site preparation	1,314.75	
Communication	<u>140.40</u>	\$49,313.07

Assaying

WO ₃ Assays		<u>1,179.00</u>
TOTAL		<u>\$50,492.07</u>

AND Dima Resources Corp LESSEE

ADDRESS 1326 Sto Wascings

CITY Vancouver

P.O. NO. 2 Dickerson

THE LESSEE AGREES THAT THE FOLLOWING VEHICLE:

TYPE OF VEHICLE 4x4 Pickup UNIT NO. 12603

IS TO BE USED IN OR BETWEEN route

THE LESSEE AGREES TO RETURN THE VEHICLE TO THE OWNER ON DATE Dec 29 1980

LESSEE RESPONSIBLE FOR ALL WINDSHIELD DAMAGE

Dan Description See Damage sheet

1. Failure of the Lessee to return the vehicle within three days after the specified time shall constitute an unauthorized taking, use and operation of the vehicle and any costs and expenses incurred by the Owner for seizure and return of the vehicle to the Owner's premises shall be recovered from the Lessee.
2. Lessee hereby indemnifies Owner against any fines or penalties assessed against Owner as a result of violation by Lessee of this agreement as to traffic and/or parking violations.
3. Lessee agrees to be responsible for all damage to the vehicle while in his possession caused by negligent operation of the vehicle.

I.E. OPERATING VEHICLE WITH LACK OF WATER - OIL - ANTIFREEZE - LUBRICANTS etc.

4. Lessee agrees to report all accidents and vehicle failures to the Owner immediately on occurrence.

5. LESSEE TO BE ONLY AUTHORIZED DRIVER.

6. Lessee agrees that the vehicle herein described must not be used, operated or driven, nor does Owner give its consent, expressed or implied, to the vehicle being used, operated or driven by any other person than the Lessee or such other driver(s) as herein specifically named.

I/we hereby agree to be bound and to comply with all of the above terms and conditions which include the terms and conditions on the "REVERSE SIDE" hereof.

PERSONAL ACCIDENT INSURANCE

BY HIS INITIALS, Lessee agrees to pay an additional fee of \$1.00 per day, or part thereof (\$5.00 weekly) for Personal Accident Insurance under a policy arranged by Bow Mac, the Terms and Conditions of which are set forth in the attached Form, Series 40892. Insurance applies during the terms this Rental Agreement is in force.

QUALIFICATION AND CERTIFICATION

I, Robert A. Dickinson, with permanent address at 1395 Ottawa Avenue, West Vancouver, B.C. declare:

1. That I graduated from the University of British Columbia with a B.Sc. degree in honours geology in 1972 and a M.Sc. degree in Business Administration in 1974.
2. That since graduation I have been employed as an exploration geologist in British Columbia, Saskatchewan, Territories, and Washington, U.S.A.
3. That I am president and exploration geologist of Dimac Resource Corp. Ltd. whose office is located at 1326 - 510 West Hastings Street, Vancouver, B.C. V6B 1L8
4. That I have an interest in the Gotcha Property.
5. That the data of this report is based on data collected by me on the property and by presentations of contractors to me during the period November 5, 1979 to January 17, 1980.
6. That to the best of my knowledge and belief the Expenditure Statement is correct.

VANCOUVER, B.C.
