PASS LAKE RESOURCES LTD. (PLJ-V)

EXPLORATION RESULTS - Donald D. Sharp, secretary-treasurer of Pass Lake Resources reports analytical data from preliminary prospecting programs on its 100%-owned Galore Creek properties and 50%-owned Telegraph Creek properties near Telegraph Creek in NW B.C. (SEE GCNL No. 208, OCT.30/89 FOR TERMS OF ACQUISITION)

At Galore Creek, results from the Cuds and Ginney claim group (320 units) which straddle the Porcupine River, indicate gold-bearing zones over widespread parts of the claims. The best assay was 0.54 oz.gold/t over 2.0 meters in a quartz-chlorite shear/vein striking NW-SE, parallel to a suspected major shear zone occupying the Porcupine River valley. Five other narrower shears/veins elsewhere carried 0.09 to 0.19 oz.gold/t with supporting silver up to 6.4 oz.silver/t plus arsenic and base metals. One stream sediment sample in a separate zone returned 3,660 parts per billion gold.

At Telegraph Creek, nine rock samples from several mineralized structures on the Bar group (185 units) contained from 85 to 2,080 ppb gold with arsenic and base metals. On the Rattle and Roll claims (220 units), a wide east-west trending alteration zone was found within with two rock samples assaying 0.29 and 0.09 oz.gold/t with anomalous silver, copper, zinc and arsenic. One vein sample on the Glen group (89 units) carried 1,610 ppb gold and 720 ppm arsenic.

Mr.Sharp said these initial results are encouraging and more work is planned next year. Pass Lake will continue to seek third party financing for subsequent exploration programs.
