CAPSULE GEOLOGY

082ENW075

001024

The area is underlain by highly fractured and altered granitic rocks of the Middle Jurassic Okanagan Batholith.

Uranium enrichment occurs in surficial soils and silts in an area measuring 16800 square metres. An auger hole intersected a 4.0 metre thick layer averaging 0.0168 % uranium with a 0.5 metre section averaging 0.03 % uranium. (Culbert, 1979). The uranium layer lies 2.5 metres below the surface.
