NEW SILVER-GOLD OREBODY

Following our recent diamond drill program, Skylark is confident that a new mine has been discovered. The property lies 1.5 miles east of Greenwood, B.C., accessed by paved road, power and water, and is suitable for year round operation.

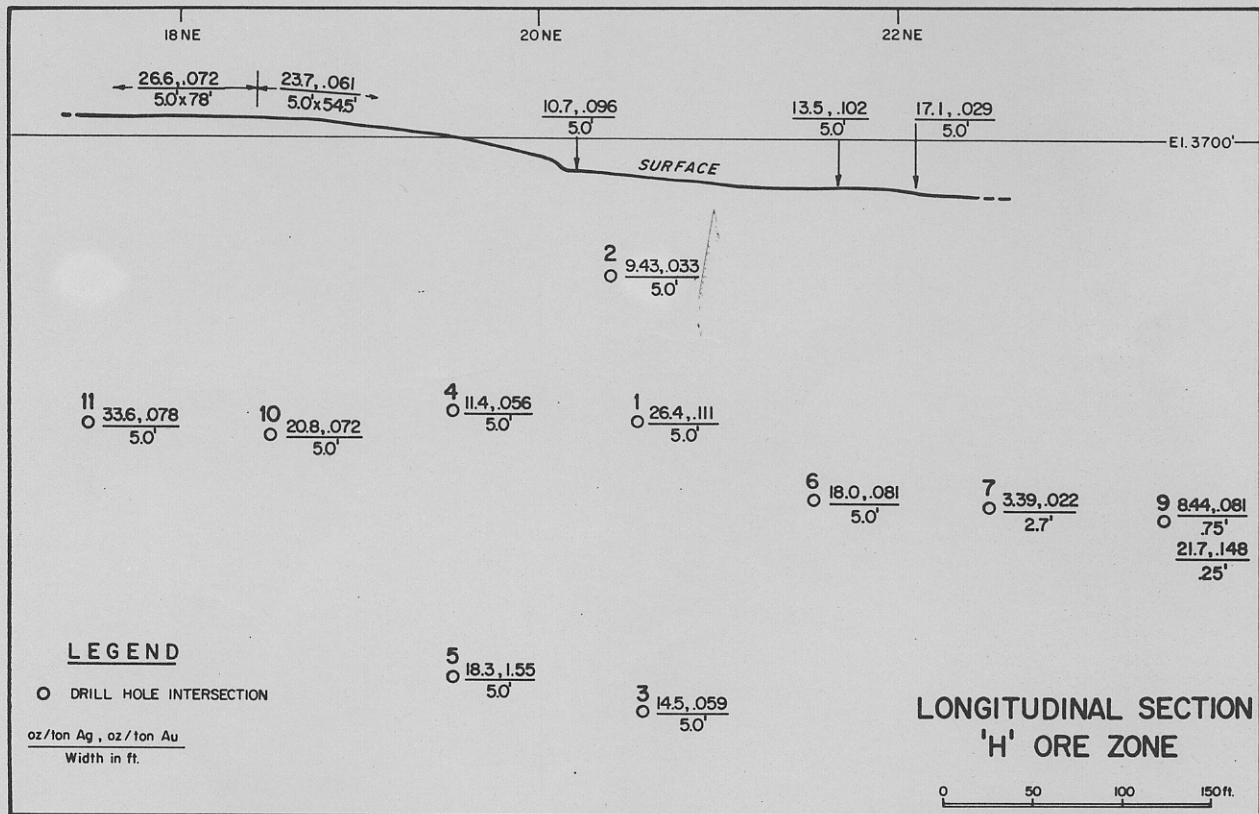

The new 'H' zone orebody lies on the south edge of the Billy Fraction claim and extends onto the O.B. claim. Skylark, as operator, is earning a 50% interest in the O.B. claim. The new discovery is a strong and continuously mineralized vein-fault zone.

From March to April, 1985, the company drilled 8 diamond drill holes, one of which was abandoned, on the new 'H' silver-gold zone. Including the 3 holes drilled in November, 1984, 10 diamond drill holes have now been completed on the 'H' zone with all holes intersecting strong mineralization. In addition, surface stripping has extended this zone another 100 feet S.W. making its known surface length 450 feet. The stripping has proven that the mineralization is continuous.

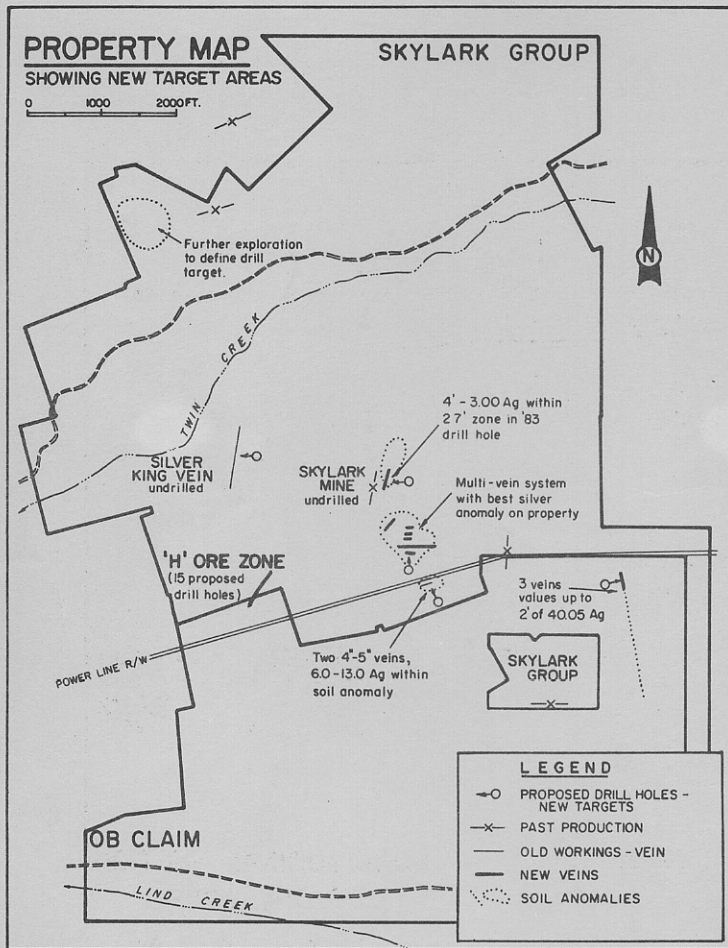

A detailed magnetometer survey indicates the 'H' zone could have a strike length of 1,000 feet. The ore grade panel is open to depth and open to the southwest. Two low grade holes intersected the 'H' zone to the northeast and have not cut it off in this direction.

Company management, working with its independent consultant, has completed preliminary calculations to a 5.0' minimum mining width on an ore grade panel 500' long with two of 8 contiguous ore grade holes intersecting the zone 300' down dip. Numerous surface samples have also been used.

These figures give this panel an inferred reserve of 58,000 tons grading 20.19 oz/ton silver and 0.080 oz/ton gold (1.171,020 oz silver and 4.460 oz gold contained). The potential exists for a substantial expansion of reserves in the 'H' ore zone.

Because of the extent and value of mineralization already encountered on the 'H' ore zone, Skylark Resources will bring this orebody through the development phase and into production and full mine status quickly.

Three new drill targets have been located on the property by recent trenching which exposed silver veins.

Two old workings, one coincident with a soil anomaly constitute two more drill targets.

These are prime areas for the development of new ore reserves and will be drilled.

Aggressive exploration will continue to test the full potential of this exciting property, while Skylark proceeds with immediate exploration and development of the 'H' ore zone.
