Control Energy Corp.has reported West Coast Securities has agreed to underwrite 450,000 shares at 25¢ each. Prior to this funding there are 2,880,000 shares issued. The funds will be used for exploration on the Montana claims near Greenwood and Westbridge, B.C.

Sookochoff Consultants Inc. 21Jan87 reported the mineralization and geological setting indicates the potential for McKinney type mineralization where irregular veins up to several hundred feet long host pyrite, galena, spalerite, and gold. 82ESE111

The potential for gold bearing mineralization on the Montana is also in association with the pelitic-volcanic sequence where mineralization could occur within the volcanic rock.

82ESE111 News Release

Mr R.S. Tanner reports:

The company announces financing through West Coast Securities. The funds provided will allow continuation of the exploration work on the Montana claims in the Greenwood mining district, near Westbridge, B.C.

Sookochoof Consultants Inc. January 21, 1987 report states:

From the information obtained to date on the mineralized zone it appears that the controlling structure sub-parallels the major structure expressed as the canyon of Canyon Creek. The mineralization and geological setting indicates the potential for McKinney type mineralization where irregular veins up to several hundred feet long host pyrite, galena, spalerite, and gold.

Grab sample assays received to date from the ongoing work program are:
