GCNL 111 KILO GOLD MINES LTD. (KGD-Alberta) June 10, 87

TWO GOLD PROSPECTS IN - Kilo Gold Mines Ltd. intends to
B.C. WILL BE EXPLORED raise up to \$288,000 in Alberta
via a private placement unit
offering with certain "flow-through" provisions for
continued development of the company's gold properties
in B.C. Dr. D.S. Evans, president, reports that funds
will be applied to both the Kilo property near Slovan in
SE B.C. and the You property on the west coast of
Vancouver Island, B.C. 082FNW189, 082KNE022

42 On the Kilo property, surface work in 1986
identified a silicified zone some 1500m long on the
Skylark-Rafter claims hosting promising gold and silver
mineralization associated with a "roof pendant" of
metasedimentary rocks that appears similar to the
setting of recent important discoveries by Northair
Mines on the Hills property at Alywin Creek, about 15 km
to the north. Trenching and up to 1000 meters of
diamond drilling are scheduled to start in early July.

On the You property, further work to include
geochemical sampling and trenching has been planned for
1987 prior to reconnaissance diamond drilling. Previous
surface work around the old mine workings identified
potential for a multiple vein system of high grade gold
mineralization. The claim holdings will be expanded.

FURTHER WORK PLANNED - Kilo Gold Mines Ltd. will continue exploration at two locations on the Beaver and FOR SLOCAN SILVER CLAIM Skylark/Ranger claims, Slocan area, B.C. as a result of positive geochemical and geological surveys. The Beaver claim is the oldest claim staked in the Slocan Valley, while the Skylark/Ranger claim in the early 1980s produced a three-ton bulk sample from which four ounces of gold and 330 ounces of silver were recovered.

82F/11W (082F NW 189)

At the Beaver claim, soil samples and trenching have outlined a broad area of interest in the eastern sector of the property and have also detailed a highly-anomalous zone in the southwestern portion. More detailed soil sampling and trenching is recommended by geologist Roy D. Kregosky.

At the Skylark/Ranger claim, grab samples from the old workings returned values amounting to 71.83 oz. silver per ton and 0.534 oz. gold per ton. A chip sample from trench seven yielded 22.08 oz. silver per ton and 0.056 oz. gold per ton.

The geological survey has traced the Skylark/Ranger vein along a length of 700 meters open to the west. Vein widths locally exceed one meter. Further geochemical and geological survey work is recommended.

GCNL #229

28 NOV 1985

KILO GOLD MINES LTD. (KGD-V)

82F/11W (082F NW 189)

CORRECTION - GOLD SILVER ASSAYS DETAILED - The gold assay at the Skylark/Ranger claims of Kilo Gold Mines Ltd. in the Slocan area of B.C. was 1.056 oz. gold/t across 20 cm, or about 8 inches. The silver assay from the same sample was 22.08 oz. silver per ton. The gold assay in the story in GCNL No. 225, page three, Nov. 22, 1985 was wrongly reported as 0.056 oz. gold/t. A report on the vein shows it to be locally greater than one meter wide. Grab samples from the old workings returned 71.83 oz silver/t and 0.534 oz. gold per ton. Further work is planned for the property.
