BIG JOHN SAMPLE RESULTS - P. Santos, president, Jopec Resources Ltd., reports underground sampling is in progress at the Big John mine 17 km SSW of Salmo, B.C. where the company can earn a 100% interest. The second batch of roto-hammer drill samples from the raise on the 3rd level has been assayed and are outlined in the table above. Excluding the footwall sample, the above samples have a weighted average of 8.82% lead, 16.68% zinc, 0.090% cadmium, 4.29 oz. silver/ton and 0.008 oz. gold/ton. Assays for gallium and germanium are pending.

Using metal prices quoted by Cominco, the gross value per ton of this material is \$304.01 Cdn. excluding values that may or may not be credited for the gallium and germanium content. The net smelter return of this

material would be approximately 65% of the gross value or in this case US \$162.57 (Cdn. \$197.67) per ton. The mineralized zone at the Big John is open along strike and down-dip. The Reemac, Annex and Redbird mines adjacent to the Big John had a potential of 10,000,000 tons. Underground roto-hammer drill sampling is continuing at the Big John.

At the Snow Creek project about 30 km south of Nakusp, B.C., where Jopec can earn a 100% interest, Westar Timber has constructed more than 16 km of haulage roads at an estimated cost of \$600,000. That company has recently completed a new access road that cuts across one of the mineralized zones in the Ice claims at an estimated cost of \$60,000. A crew has been organized to conduct roto-hammer drill sampling across the exposed mineralized zone. (SEE GCHL No.51, 12Mar92, P.2 FOR PREVIOUS INFORMATION)
