GOLD SHOWINGS ON OLD MINESITE IN B.C. BEING TESTED

(082KSW038)

Larry Bratvold, president, announces that Havilah Gold Mines Ltd. has negotiated a joint venture with Rawhide Minerals Ltd. to acquire and develop the old Eureka Mine site on Mt. Brennan near Kaslo, in SE B.C. Havilah has started preliminary investigation of the gold veins on this property.

Trenching of the vein structure has uncovered a mineralized zone more than 44 feet wide. About 259 feet below that, an old exploration adit has been mapped and sampled by Randy Clarkson P. Eng. of New Era Engineering. Channel samples of the vein in the adit were assayed, SEE TABLE.

Underground mapping and the width of the surface exposure of the shear zone indicate that the full extent of the zone is not exposed underground. Mr. Bratvold says, "Structural geology is most likely to lead to new discoveries of parallel zones and to intersections of the two major joint systems."

Mr. Clarkson has recommended that the surface be geologically mapped with reference to structure. Surface trenching should be done to sample shear zones containing quartz or

carbonate fillings. As recommended by Mr. Clarkson, this summer a geochemical soil sampling program will be undertaken concurrently with geological mapping. Once the geology and geochemistry have been interpreted, core drilling from the surface will investigate further the nature of the mineralized zones.
