TAY GROUP - Taylor River

84/10/03

724-1261 - Rm. 107 - Glen Harder  
(Esta Villa?)

- no one on property except drill crew (MOB Drilling)
- setting up one new drill hole just below & to east of main showing. - drilling toward showing @  $-30^\circ$  - (lower hole appears nearly flat!)
- massive dark green Karmutsen basalt in some areas of massive diorite (probab. Jurassic)
- several occurrences of massive dacitic f.p. dykes up to several metres wide - most trend NE to ENE & appear vertical.
- main showing is vertical (?) silicified breccia zone striking  $080^\circ$  & at least 2m. wide - abundant py dissem. & coating stockwork of fractures in bx.
- bx. zone is adjacent to & sub-parallel to narrow grey dacitic f.p. intrusion. (Tertiary?)
- although heavily silicified, most of bx. seems to be f.p. rather than basalt.
- in vicinity of showing, basalt is less magnetic than usual.
- diorite & f.p. not seen in contact but at one road junction, fractures in diorite seem to be filled w/ thin seams of glassy f.p.
