PILLDOLLA/JI: Pamicon Developments Ltd.: 92K/8 & 92G/13: Scott Weekes/Doug Fulcher (684-5901). (See also John Kerr, Suite 1003, 470 Granville Street, Vancouver VB6C 1V5, phone 681-2271; FAX 681-3717)

Aquaterre (Thomas Waterland) plans to conduct geological and geophysical programmes on a 6,000 acre volcanic "roof pendant" VMS target on Jervis Inlet (Pilldolla). It will also conduct geological, geophysical and geochemical programmes and possibly drilling of targets on a Cu anomaly on the JI property on Jervis Inlet (NM 18th July).

Pamicon Developments will run IP, mapping and soil geochemical programmes on the JI and prospecting and mapping programmes on the Pilldolla property between July and September, 1994 (NOW).

The company applied for a MEIP grant. It did not get one.

The company ran field mapping, sampling and float followup survey over the summer and located a mineralized shear zone 6 to 8 km long. (CS 27th September).

Work done by Myra Shatten and John Kerr. Bad weather limited their ability to do much on the Pilldolla. They traced the boulders back up to a steep cliff with a bit of an overhang. It looks as if the boulders come from a "cave" area within the face. Difficult to access. The cliff appears to be part of a major shear zones. Sulphides presumably come from the shear. Expenditure less than expected (\$50,000?RHP)

Good geochem, IP and geology targets over Gambier stratigraphy at JI. Four close spaced targets within stratigraphy but no known showings. Difficult to hand-trench. Spent \$70,000 this year. Plans to drill next year ... looking for funds. (John Kerr pers comm December, 1994)
