PRINCETON PROPERTY - An examination option on the 76 unit Mount Rabbitt copper property located 40 kilometers north west of Princeton in the Tulameen district of B.C. has been granted to Teck Mining Group Limited.

Under the agreement Teck has agreed to carry out an examination of the property, including geological, geophysical and geochemical survey work prior to 1Jun79. On that date Teck is to give notice of its intent to spend a minimum of \$50,000 on exploration of the property by 1Dec79, or return the ground to the company. If Teck exercises its option to work on the property in 1979 then it will have similar annual options to spend \$50,000 in each of the next five years, to a total minimum of \$250,000, until 1Jun84. On this date Teck has the option to commit the property to production or retain the property by payment of \$25,000 per year to Northern Lights Resources until such time as Teck decides that the property does warrant production.

If and when the property does attain production then the net proceeds from production are to be divided 20% to Northern Lights and 80% to Teck.

In a report on the property dated Oct. 2/78, R.W. Phendler, P. Eng., stated that the Ingerbelle Mine is in "disseminated chalcopryrite ore bodies...in sheared Nicola andesites (and is) in a similar geological environment to the Mount Rabbitt area." Chalcopryrite occurs as disseminations and as vein-like bodies within sheared and silicified Nicola volcanics. Chip samples taken by Mr. Phendler assayed 3.40% copper across 27 feet, 5.45% copper across 18 feet and 1.64% copper across 15 feet. The samples came from trenches which are located along a northerly striking zone that may be traced along the west half of the claims over three kilometers! An induced polarization anomaly located in 1968 measures 600 feet by 200 feet, is three times background and has never been drill tested.

A second area on the property, the Cousin Jack showing, contains mineralization over a considerable distance (1200 feet) with principal values in zinc and gold. Chip sampling by a government geologist in 1960 returned assays from 2.3% to 19.1% zinc and from a trace to 0.32 oz. gold per ton across two to six feet.

In recommending further exploration work on the property, Mr. Phendler states, "The shearing of the andesites is particularly significant, as are the zones of disseminated chalcopryrite mineralization.

"The possibility exists that a large low grade deposit of copper mineralization occurs on the Mount Rabbitt property."

Teck has indicated that property work will start in the next few weeks as soon as weather conditions permit.

Ken Newton, president of Northern Lights Resources, stated that, with this project now under the direction of Teck Corp., the company is seeking new projects, a number of which are under preliminary discussions. A notice of new financing is expected to be made in the

BRICAN RESOURCES LTD. (BRI-V) ABERMIN CORPORATION (ABM-V)

EXPLORATION WILL CONTINUE ON THE - Abermin Corporation and Brican Resources Ltd. plan an aggressive 1986 program of JOINT VENTURE'S TULAMEEN CLAIMS exploration on their Rabbit Mountain joint venture. Brican acquired this large claim block near Tulameen in Princeton mining division, B.C. in 1980. Brican vice president G. Logan says a total of \$140,000 was spent on its exploration up to 31Dec84 when Abermin's predecessor company formed the joint venture with Brican. Since then, Abermin has spent \$130,000 on the project. In 1985, surface exploration in the northern half defined several attractive targets. Geological, geophysical and geochemical surveys are used to delineate zones of potentially significant precious and base metal mineralization.

In 1986, Abermin will spend at least \$100,000 to identify targets for trenching and drilling. Abermin may earn 75% property interest by spending \$1,000,000 by 1Mar90. Abermin has now made the 1Mar86 payment of \$10,000 to Brican.

NMINER
10 MARCH 1986

Abermin, Brican plan program

VANCOUVER - Abermin Corp. and Brican Resources are planning an aggressive 1986 program of exploration on their Rabbit Mountain joint venture.

Brican acquired this large claim block near Tulameen in the Princeton mining division of B.C. in 1980. A total of \$140,000 was spent on exploration up to the end of 1984 when Abermin's predecessor company formed the current joint venture with Brican.

Since then, Abermin has spent \$130,000 on the project. In 1985, a systematic surface exploration program on the northern half of the property defined several attractive targets. Detailed geological, geophysical and geochemical surveys are being used to delineate zones of potentially significant precious and base metal mineralization.

The 1986 program will explore the southern part of the property and more intensive follow-up exploration will be carried out on the targets already identified on the northern claims. At least \$100,000 will be spent by Abermin to identify targets for trenching and drilling.

Under the terms of the joint venture agreement, Abermin may earn a 75% interest in the property by spending \$1,000,000 before March 1, 1990. As part of the agreement, Abermin now has made this year's March 1 payment of \$10,000 to Brican.
