DRC RESOURCES CORPORATION

DRC Resources Corporation is focused on the exploration and development of the Afton Mine Property, located 6 miles (10 kms) west of Kamloops, B.C. With C\$5 million in working capital the Company is well financed to carry out the next phase of exploration.

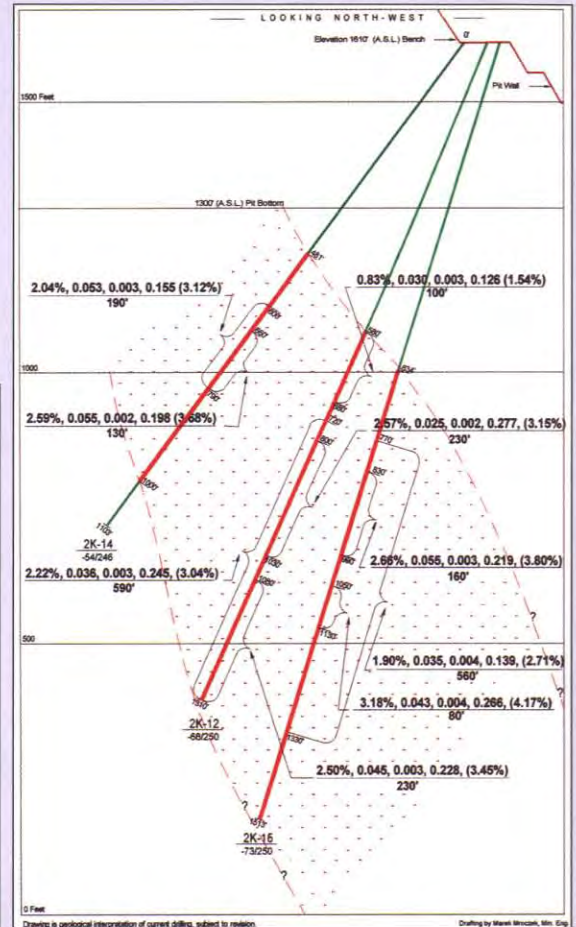

Afton Mine Property

In the year 2000, 21 NQ Diamond Drill Holes (30,575 feet) outlined a wide "feeder zone" below and to the southwest of the Afton open-pit. The mineral zone is a steeply dipping tabular body 1200 ft (365 m) in length, averaging 250 ft (76 m) in width and extending to at least 1000 ft (303 m) below pit bottom. The zone is open in all directions with no indication of narrowing except towards surface.

J.J. McDougall Geological Engineering Study

J.J. McDougall, P. Eng. estimates a 25 million ton Indicated Mineral Resource averages 2.00% copper, 0.045 oz/t gold, 0.004 oz/t palladium, and 0.20 oz/t silver for a 3.0% copper equivalent (60 pounds copper/ton). *(Metal Prices in Can.\$: Cu \$1.20/lb, Au \$420/oz., Pd \$900/oz., Ag \$7.50/oz.)

An Exploration Budget of C\$4,700,000 is recommended for further exploration of the Afton mineral zone.

Behre Dolbear Scoping Study

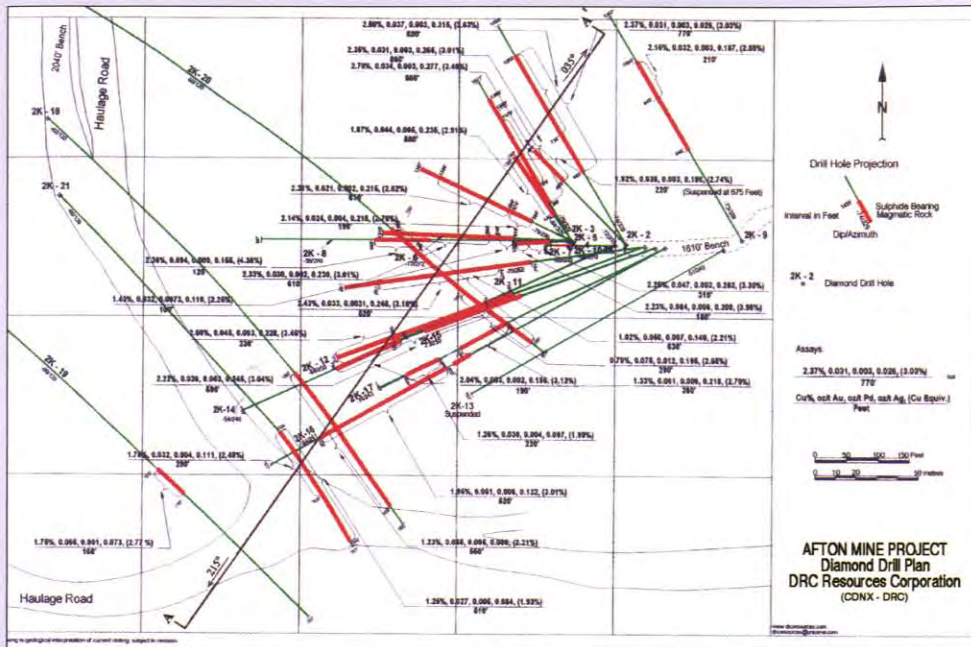

Behre Dolbear & Company Ltd. completed a Scoping Study which determined that the Afton project has favorable economic possibilities with low production costs, moderate capital requirements, and relatively low environmental concerns.

- Block Caving 4500 tons/day

Process Research Metallurgical Study

Process Research Associates Ltd. has prepared a preliminary flotation study indicating good metal recovery: copper 89%, gold 90%, palladium 76%, platinum 99%, and silver 90%.

The locked cycle test produced a final cleaner concentrate containing 41% copper, 0.83 oz/t gold, 0.05 oz/t palladium, 0.006 oz/t platinum and 3.73 oz/t silver.

J.F. Harris Petrographic Study

J.F. Harris, Ph.D., petrographic study of drill core indicates the finely disseminated copper sulphides appear to be of "magmatic" origin resembling certain types of gabbroic/anorthositic rocks associated with nickel and platinum-group deposits. Since the sulphides are disseminated and not dependent on the degree of fracturing, there is good potential for a more extensive mineral zone.
