Only one outcrop of greenstone has been found on the surface above the workings, but it has been found underground at the eastern end of several drifts on the "51" vein. As the drifts were stopped shortly after entering the greenstone, only a small amount of the greenstone could be seen, and this was usually badly sheared material. However, it appears to possess features characteristic of lava of the Pioneer formation.

In the eastern face of 451 drift on the 400
