PROPERTY FILE

Date: August 28th, 1992:

Subject: Teihsum Creek Mineral Showings: 92L/6W

Jim Laird dropped by the office and showed me some photo's maps and rocks from a "new" mineral property that he has located on Teihsum Creek, southeast of Victoria Lake.

(1) The property covers an area of manto lead-zinc and structurally controlled epithermal gold mineralization in Parson's Bay limestone on the west side of Merry Widow Mountain.

(2) Jim has located banded base-metal sulphide "manto?" lenses in clean fossiliferous limestone in the stream bed below the Bridge zone (see attachments).

(3) He has also located an area of brecciated limestone which shows intense (chalcedonic) silicification and variable sulphide and gold mineralization.

(4) He feels that the chalcedonic breccia is "up-section" and thus a shallow manifestation of skarn mineralization of the type found at Merry Widow.

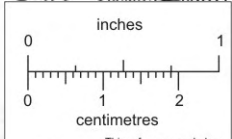

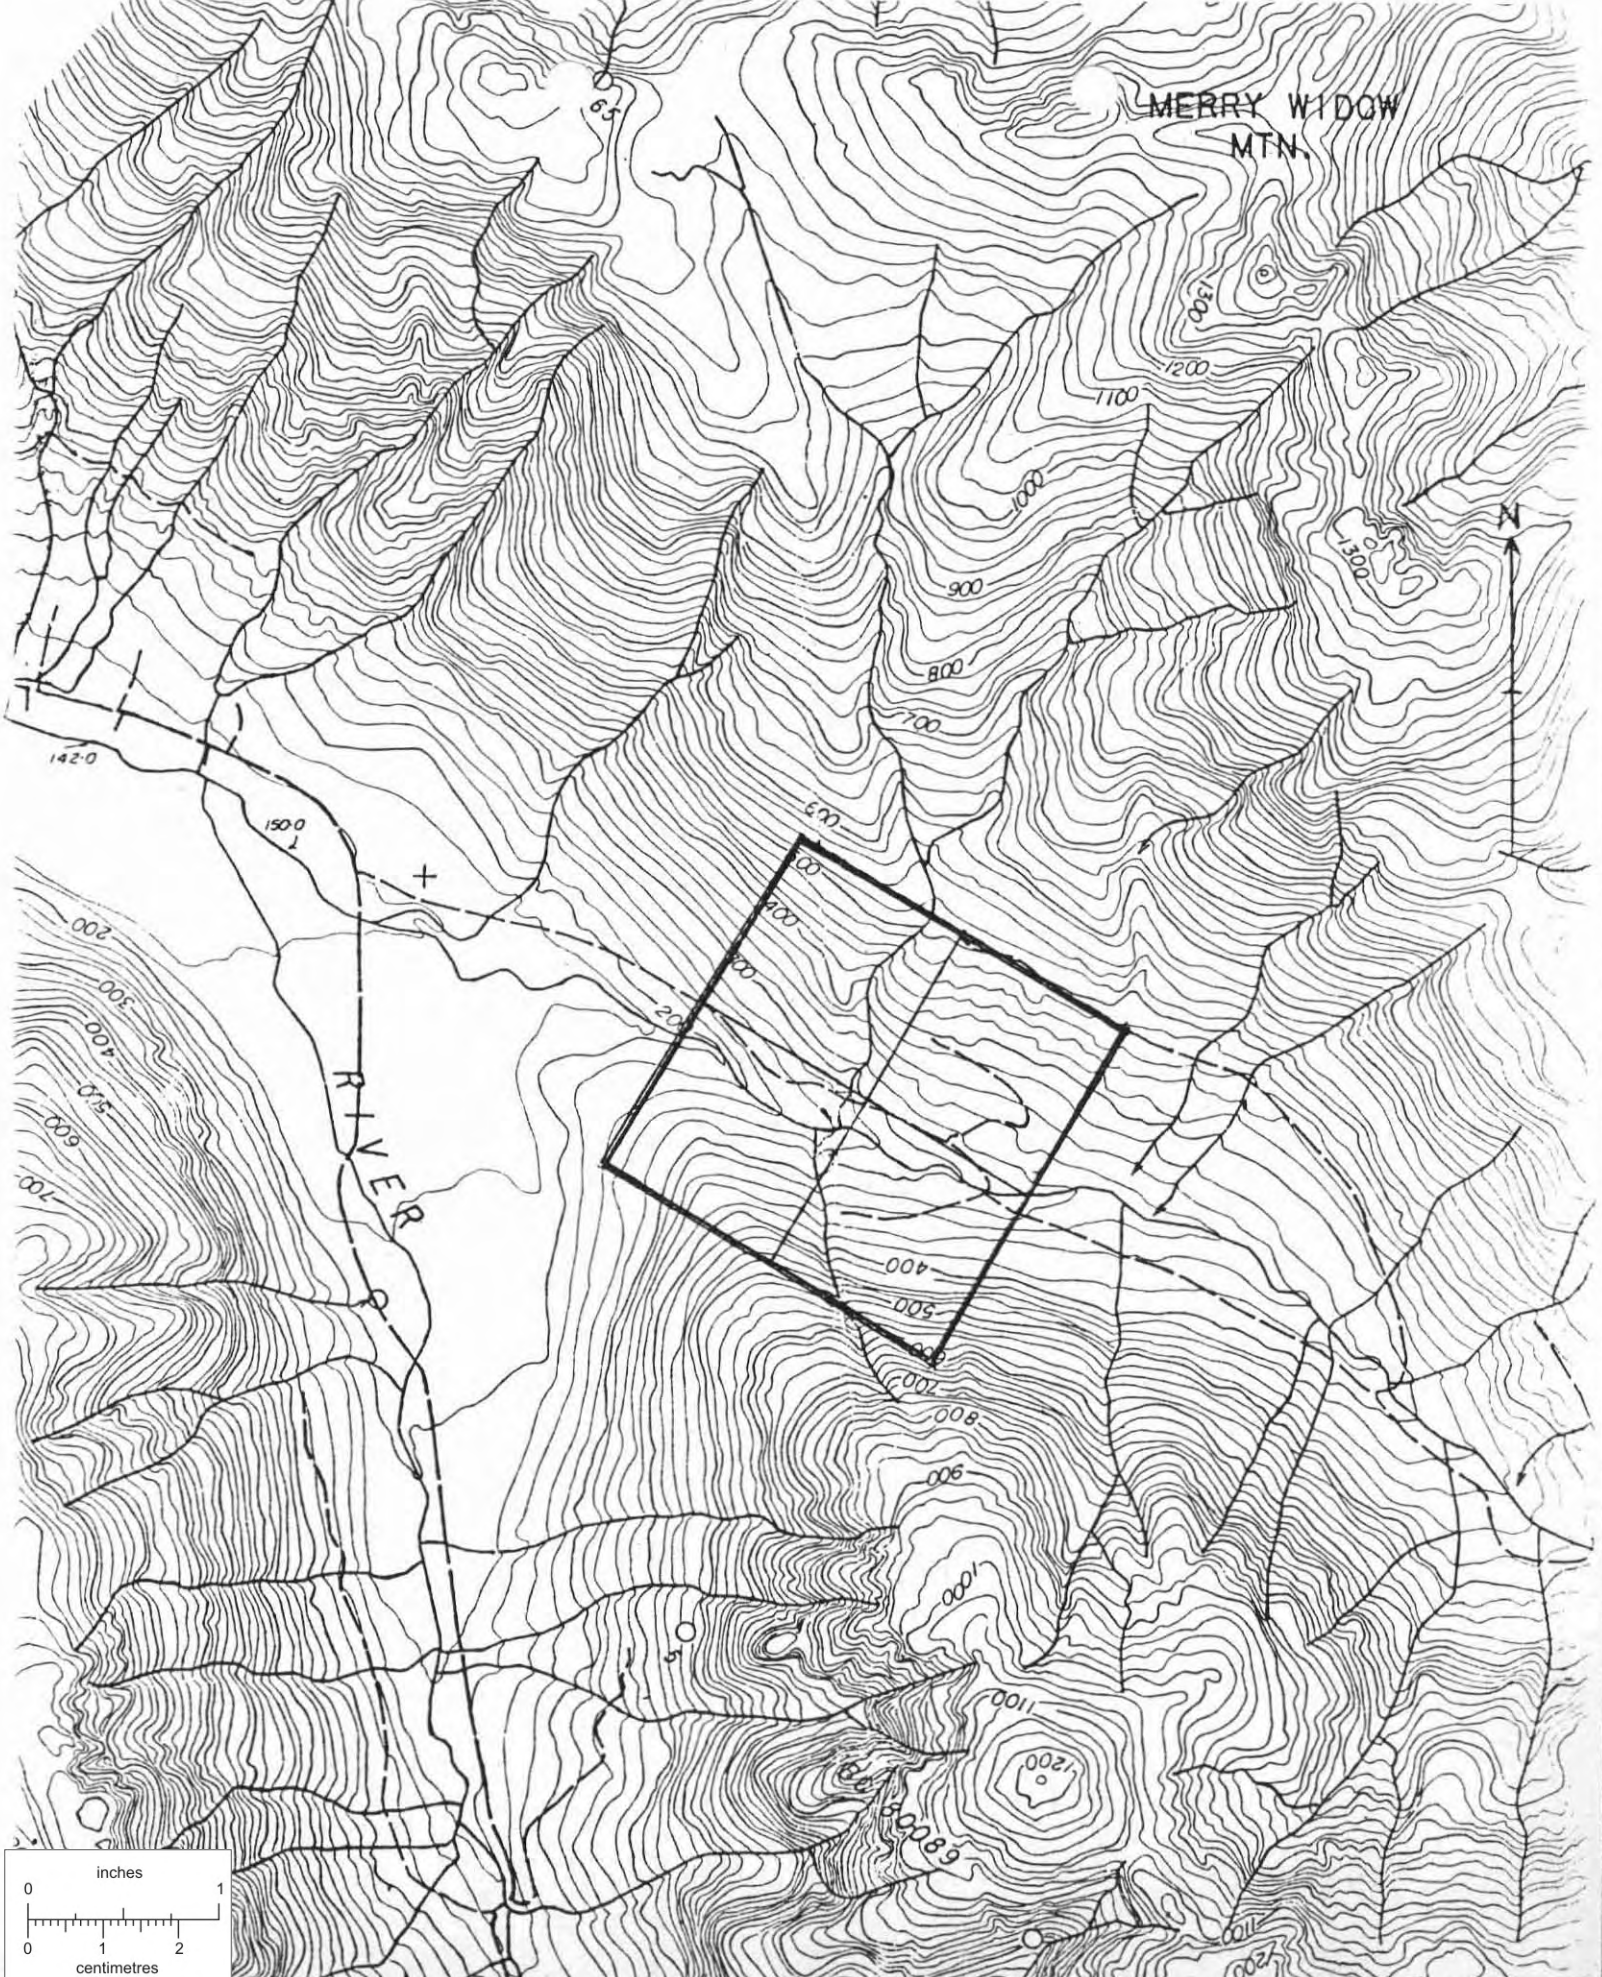

(5) He has also located realgar-rich veins at the Red Devil.

Jim feels that there is a mineralized structure extending from the West Ruby zone through to a cross-structure in the skarn-teaser-bridge area. His photos indicate large areas of alteration. The area has not had much in the way of exploration (see ARs 12,404 and 14,086). It could host deep epithermal gold veins that are transitional into some form of skarn mineralization.

What age is the Merry Widow pluton?

R. H. Pinsent

MERRY WIDOW
MTN.
