**POSTED**

A group of claims known as Sue were sampled between August 31, 1980 and September 2, 1980. These claims are in the French Peak area north of Smithers, B.C. Assay results and map enclosed.

Mineralization is emplaced in a very strong fault or shear zone cutting Bowser sedimentary rocks. The structure seems to parallel Hepworth Creek. In decreasing abundance the minerals are pyrite, calcite, quartz, sphalerite, galena and ~~ew~~weelite (a silver bearing sulphosalt). Veins are present over a 600 foot strike length. Faulting and brecciation splits the vein and causes it to pinch and swell.

One and a half claims to the north in the creek-bed similar mineralization has been found but on a much reduced scale.

<u>SAMPLE #</u>	<u>DESCRIPTION</u>
40076	channel - wallrock - sediments - minor pyrite over 5.5'
40077	massive pyrite, lesser Pb adjoins west of previous minor sb. over 2.0'
40078	rusty sediments, minor pyrite and sphalerite, adjoins west of previous over 5.0'
40079	altered sediments + 40% pyrite, chalcopyrite, galena, sphalerite. 55' south of previous over 6'.

40082	2' chip - 80% pyrite, galena - adjoins east of 40079.
40083	3' chip - south end of baseline @ creek - sediments with 20% pyrite tetrahedrite, galena and sphalerite.
40084	sediment - oxidized - Pb-Zn + 10% chip over 3' - 50' north of previous.
40085	chips over 2' x 2' mineralized outcrop contains pyrite, pyrrhotite, chalcopyrite, sphalerite - 40' north of 40076.
