

THE DOBBIN PGM-COPPER PROJECT, KELOWNA, BRITISH COLUMBIA

With possibly the best PGM hole ever drilled in British Columbia, Canada

Owned by: Verdstone Gold Corporation (50%) & Molycor Gold Corporation (50%)

Verdstone and Molycor in a 1997 drill program have shown that this old copper-molybdenum camp (Tadpole Lake), which lies in a mineral rich trend that strikes southwest and transects the Brenda mine, also has potential for PGM's and silver.

The Property (3,650 hectares) has significant untested potential - especially the PGM's in pyroxenites. In addition, the Property has the following attributes:

- (1) in a known mineral rich trend near a large past producing mine (Brenda),
- (2) has attracted "majors" several times in the past for molybdenum, gold & copper,
- (3) readily accessible via well maintained logging roads,
- (4) close to significant resource and social infrastructure (25 km west of Kelowna),
- (5) exploration Notices of Work readily approved,
- (6) B.C. Geological Survey Branch releasing report on the property & area at Roundup 2001,
- (7) PGM's are presently "hot" in the equity markets, and
- (8) timing may be very good for a pending change in B.C. back to a business friendly (including resource development) provincial government.

Best intersection in 1997 core drilling program: 111 meters grading 0.19% copper, 0.410 g/t palladium and 0.352 g/t platinum. Contained within this interval is 15 meters grading 0.54% copper, 0.949 g/t palladium and 1.316 g/t platinum.

There is also potential for discovery of higher-grade mineralization in breccia and/or shear zones adjacent to the recent PGM-copper discovery.

The Property is available for option.
