Moore Creek Exam

The Moore Creek area has ~~return~~ been known to show anomalous strata rich in geochemistry (copper & molybdenum) since the early 1960's ~~and~~ ~~several~~ Reconnaissance programs have been over on the area in the ^{1960's} ~~part~~ in the search for potential deposits without indicating anything just by any serious physical work. At that time of course, silver was of little interest & was generally not tested for.

The geological setting of the property is in a area more generally noted for vein deposits than for massive sulfide deposits. The Stamp Lake vein system, some 1 km to the Stamp Lake has had a modest production in past years.

The Tolman Lake deposit lies 1/2 km to the ~~west~~ ^{east}. This may be volcanogenic in origin. The writer has not seen the deposit nor ~~is~~ ^{is} any ~~published~~ discussion of its origin in print. However from published ~~into~~ descriptions of the mineralization there seems - in the writer's view - a good possibility that the deposit is volcanogenic in origin. In this light
