INTRODUCTION

This report was prepared at the request of Mr. Walter Fowler, President, Kingdom Resources Ltd., Suite 1030, 777 Hornby Street, Vancouver, British Columbia.

The purpose for this evaluation of the GOLD CLIFF and RUFUS-ARGYLE claim groups is to assess the mine-making potential of the mineralized zones.

The properties are located near Stewart, British Columbia. They were examined on August 13, 1979 and form the basis for this report.

A program of mineral exploration is recommended.

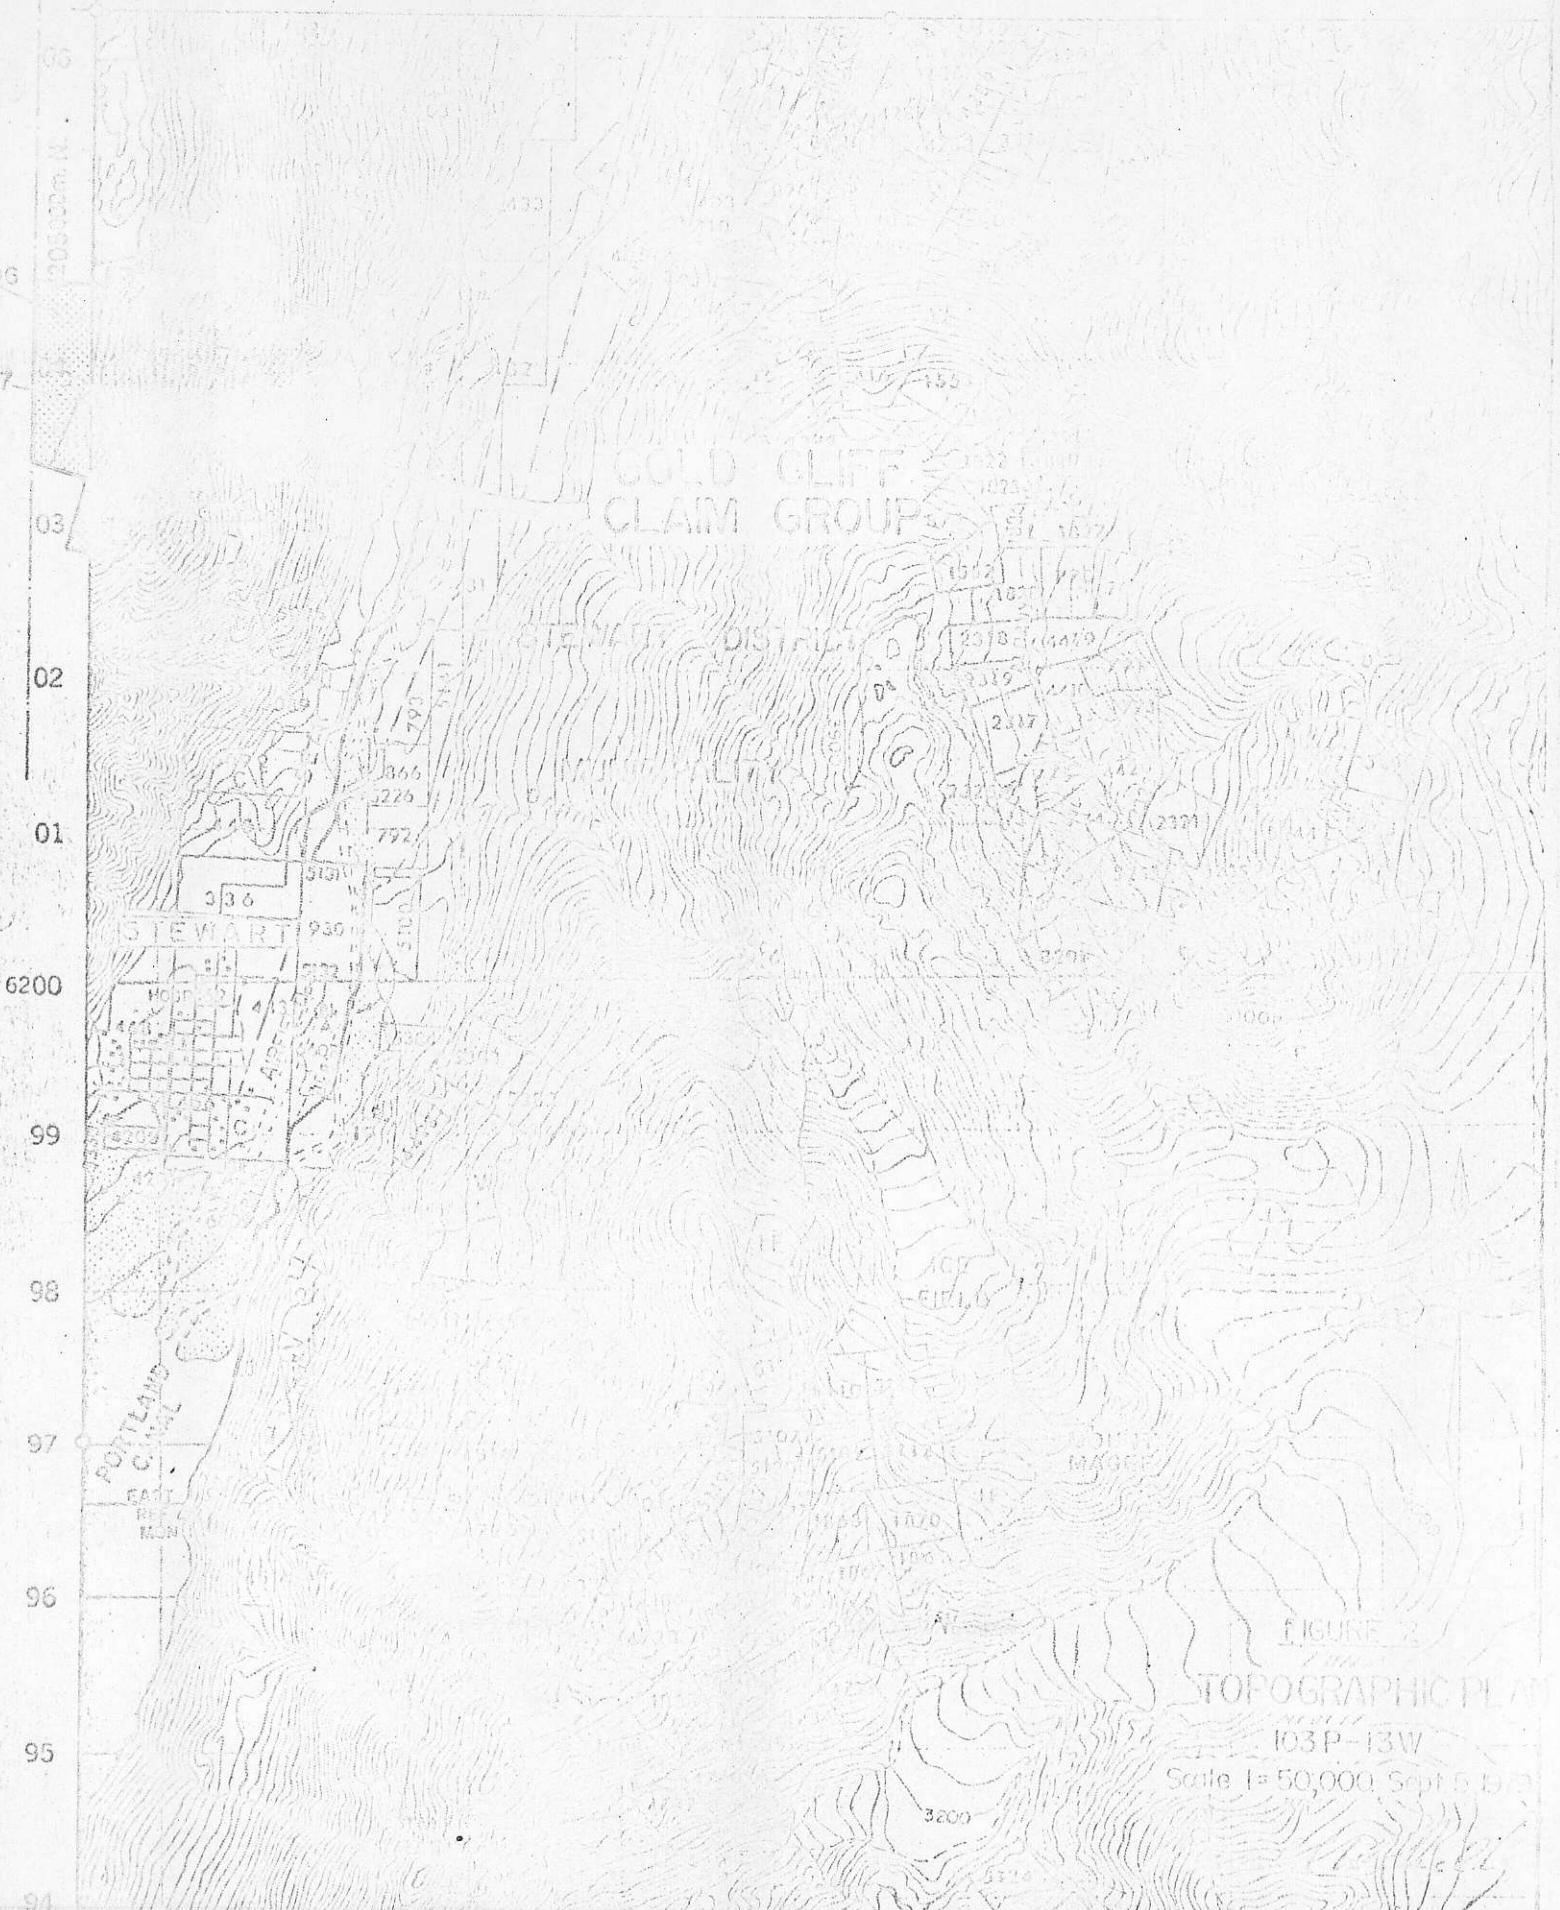

SUMMARY AND CONCLUSIONS

Kingdom Resources Ltd. holds an option to acquire two groups of mineral claims in the Stewart Area, British Columbia. The claim groups are the GOLD CLIFF comprising fifteen contiguous mineral claims located about three miles north of the Town of Stewart and the RUFUS-ARGYLE group of 20 located on the north side of the Bear River about fourteen air miles northeast of Stewart. Access is possible over steep mountainous trails on both properties but the most feasible alternative mode of transportation at present is the helicopter. Road access along the Bear River Road is available to the south end of the RUFUS-ARGYLE group where a trail leads northward along the west side of Rufus Creek.

The GOLD CLIFF and RUFUS-ARGYLE groups of claims are located in the heart of a famous mining camp comprising

ADVANCE PLATE

38 439000m.E. 40 41 42 43 44 45 46 47

the Silbak-Premier, Big Missouri, Porter-Idaho, Prosperity, Donwell and other mining properties that have produced substantial amounts of gold-silver lead and zinc over the years.

In 1925 some nine tons of ore was reported shipped from the present Gold Cliff ground averaging 121 ounces of silver, 16.5% lead, 21.5% zinc and \$1.40 gold per ton. The writer obtained a selected grab sample from the dump (Fig. 6) which assayed 15.25 ounces of silver per ton.

A program of diamond drilling is proposed for both the Gold Cliff and Rufus-Argyle claim groups.

The estimated cost of the recommended work program is \$136,675.

PROPERTY - LOCATION, ACCESS, PHYSIOGRAPHY

The Gold Cliff group of fifteen mineral claims are situated on the east-facing slope of Mount Dolly some three miles north of the Town of Stewart, British Columbia. The Rufus-Argyle group comprises twenty claims located on the north side of the Bear River about fourteen miles northeast of Stewart. The Bear River Road provides good access to the south side of the Rufus-Argyle group. Road access to the Gold Cliff group is not feasible at the present time.

Elevations over the Gold Cliff Group range from about 200 feet at the east side of the claims to over 5,500 feet on the northwest sector of the property. The Rufus-Argyle property varies in elevation from about 900 feet on the south portion of the claim group at the Bear River to

54 55 56 57

FIGURE 2a.

TOPOGRAPHIC PLAN

101A 191

Scale 1:50,000 Sept. 5, 1971

over 5,000 feet at the north side of the ground. Rufus Creek traverses the Rufus-Argyle claims and provides ample water for any industrial needs. Numerous small streams were noted on the Gold Cliff group to supply a diamond drill program. The topography over both properties is steep and tends to be precipitous locally.

CLAIMS

Two groups of reverted crown-granted mineral claims are located in the Skeena Mining Division, Cassiar Land District, Stewart, British Columbia. These are the GOLD CLIFF group of fifteen contiguous claims situated about three miles north of the town of Stewart adjoining the Alaska-British Columbia border and the RUFUS-ARGYLE group of twenty claims, not all contiguous, located on the north side of the Bear River (Figures 3, 3a, 3b). Information file with the B.C. Ministry of Mines and Petroleum Resources on September 7, 1979 was as follows:

<u>355.26 hectares (877.65 acres)</u>					

The Comet, Rufus No. 6 and the Veteran claims are not contiguous with the main claim group.

The claims are shown on British Columbia Ministry of Mines and Petroleum Resources claim maps M103-P-13W and 104-A-4W.

HISTORY - PREVIOUS DEVELOPMENT

Reference to mineralization in the area of the GOLD CLIFF claim group was first made in the British Columbia Minister of Mines Reports for the years 1910, 1915, 1919 and 1920. In 1921 the Bayview No. 1 and No. 2 were acquired by George and W.A. Cameron, Stewart, B.C., who also staked among

other claims the Lucille No. 1 as a group of claims on the southeast side of Mount Dolly. These claims were controlled by the Bayview Syndicate which did development work in 1921 and 1922 on a vein on the granite-sediment contact that trends northeasterly through the claims. This vein was opened up by trenching for about 300 feet along a N 30° E strike at about the 3,700 foot elevation and dipped steeply northwest. The Syndicate drove a crosscut tunnel some 100 feet below the vein outcrop but failed to intersect mineralization. Several narrow veins carrying galena and sphalerite striking along the westerly trending granite contact were reported.

W. Dann, N. Dann and J. Douville of Stewart acquired control of the Bayview Syndicate in 1925 and did some cross-cutting and drifting. They discovered a vein on the Lucille No. 1 claim and drove the No. 2 adit on it. According to the record some nine tons was shipped averaging 121 ounces of silver, 16.5% lead, 21.5% zinc and \$1.40 gold per ton from a vein varying between 1 and 4 feet in width. The Lucille vein strikes northwest and dips about 45° southwest. Memoir 175 of the Geological Survey of Canada reported another parallel vein some seventy feet above and a similar distance west of this vein. Both veins are well mineralized with galena, sphalerite, pyrite and tetrahedrite. The writer took a grab sample from the dump below the No. 2 adit portal which assayed 15.25 ounces of silver and showed substantial amounts of galena, sphalerite, pyrite and pyrrhotite in the hand specimen.

The United Empire Gold and Silver Mining Company Limited acquired and surveyed the claim holdings of the Bayview Syndicate in 1928. This company did work on the upward continuation of the Lucille Vein on surface between the 3,400 and 3,700 elevations and deepened the tunnel in 1930.

<u>Vein Name</u>	<u>Eleva-</u> <u>tion</u>	<u>Location</u>	<u>Strike</u>	<u>Dip</u>	<u>Length</u>	<u>Width</u>	<u>Minerals</u> <u>reported</u>
Erickson	3400 ft.	Veteran Veteran No. 3 Comet	N60°E	N50°W	4500 ft.	30 ft.	Chalcopyrite Pyrite Hematite
Morton	4700 ft.	500 ft. west of Comet Vein	N50°E	S50°E	200 ft.	20 in.	Galena Sphalerite
Blue	4700 ft.	Near Comet and Comet No. 1	N30°W	S50°W	Not given	10 in.	Gold Silver Lead Copper
Comet	5000 ft.	Comet, Comet No. 1 and Comet No. 2	N20°E	S85°E	3500 ft.	Up to 40 ft.	Pyrite Arsenopyrite Chalcopyrite Silver
New Lead	Not given	Veteran No. 1	N30°E	S70°E	300 ft.	Up to 8 ft.	Pyrite Chalcopyrite Galena

Most of the former development work was in the form of trenching and adit-tunnels done by the former Rufus Silver-Lead Mines and the Argenta Mines which were consolidated into Rufus Argenta Mines, Ltd. in 1928.

High-grade assays of gold and silver have been reported from the Rufus and Comet groups of mineral claims and considerable development work has been noted. A glacier lying above the claim group has caused rock debris to cover most of the old workings which are now difficult to recognize because of glacial debris and cave.

The claims should be mapped.

by E.W. Grove

REGIONAL AND LOCAL GEOLOGICAL SETTING

British Columbia Ministry of Mines and Petroleum Resources Bulletin No. 58 shows the regional geology of the Stewart Area.

The Stewart Map-Area is dominated geologically by formations of the Upper Hazelton assemblage of sediments and volcanics. These rocks are intruded by plutonic rocks of the Coast Crystalline Belt. The core of the Coast Mountains which are prominent throughout the region is a metamorphic equivalent of the Lower Hazelton metasediments.

Two lithologic units are recognized on the Gold Cliff claim group, namely, lower to middle Jurassic argillites and sandstones intruded by the Hyder quartz monzonite and granodiorite with dyke facies.

The Rufus-Argyle claim group is underlain by sediments of the Bitter Creek formation.

A tentative table of geologic formations is as follows:

<u>Formation</u>	<u>Description/Event</u>	<u>Age</u>
Sand, gravel and glacial debris	Unconsolidated	Quaternary
	Erosional unconformity Tectonic activity	
Mineralization Quartz veining	Gold, silver, tungsten, Galena, sphalerite, chalcopyrite, tetrahedrite, arsenopyrite, pyrrhotite and pyrite	
	Faulting and tectonic activity	

<u>Formation</u>	<u>Description/Event</u>	<u>Age</u>
Coast Crystalline Belt Intrusions	Quartz Monzonite, Granodiorite, Felsic and mafic dykes Faulting and tectonic activity	Tertiary and Earlier
Upper Hazelton sediments and Bitter Creek Formation	Argillite, limestone, conglomerate, sandstones, pelites and volcanics Tectonic activity	Lower to Middle Jurassic
Metamorphic equivalents of the Lower Hazelton sedimentary assemblage	Greenschist facies, phyllites, mylonites	Jura-Cretaceous

Structurally, the trend of the rock formations is north-northwesterly. Folding has produced anticlinal and synclinal axes in the sedimentary horizons on both the Gold Cliff and the Rufus-Argyle groups. Faulting is common both in the longitudinal and transverse directions relative to the fold structures.

Mineralization frequently follows fissure-type vein fillings along the contacts of quartz porphyry dykes. Veins on the Gold Cliff group extend northwesterly from the intrusive contact.

The Rufus-Argyle group is marked by a reddish brown gossan over a large portion of the claim group and appears to be the result of the oxidation of a finely disseminated and pervasive pyrite through most of the rock types in this area.

MINERALIZATION

The vein zones on the Gold Cliff and Rufus Argyle claim groups are a combination of fissure-filling and wall-rock replacement types. Quartz in veins and veinlets occupy the fissure-fracture openings and the sulphide minerals replace openings in the quartz and wall-rock. Metals characteristic of the area are gold, silver, copper, lead, zinc. Recently tungsten has been noted on frequent occasions. The sulphide minerals are pyrite, pyrrhotite, sphalerite, galena, chalcopyrite, tetrahedrite and often arsenopyrite when gold is present.

The Gold Cliff showings are about the 3,000-foot elevation. Although the workings are now caved-in, the trend of the mineralized structures is northwest (Figure 5) and the dip is relatively flat to the southwest. The veins occur in sediments that grade between argillites and impure sandstones. The dump below the portal of the No. 2 adit has considerable mineralized rock carrying quartz and sulphides. A selected grab sample taken from this dump showed galena, sphalerite, pyrite, pyrrhotite and fine veinlets of quartz in a skarn-hornfels host rock that exhibited a mauve color. This sample assayed as follows:

Sample #26199 -	Gold	-	0.012 oz
	Silver	-	15.25 oz
	WO ₃	-	0.05%

A contact of the sediments and a granodiorite intrusive trends northeasterly across the ground below the No. 2 Adit and the lower No. 1 adit (Figure 5).

On the Rufus-Argyle group a small adit now caved-in showed mineralized vein material in a brown oxidized host rock

of apparent sedimentary origin. A selected grab sample of the mineralized vein on the dump below the adit assayed as follows:

Sample #26200	-	Gold	-	0.118 oz
		Silver	-	0.29 oz
		WO ₃	-	0.05%

Pyrite and pyrrhotite with quartz were noted in the sample taken.

RECOMMENDATIONS

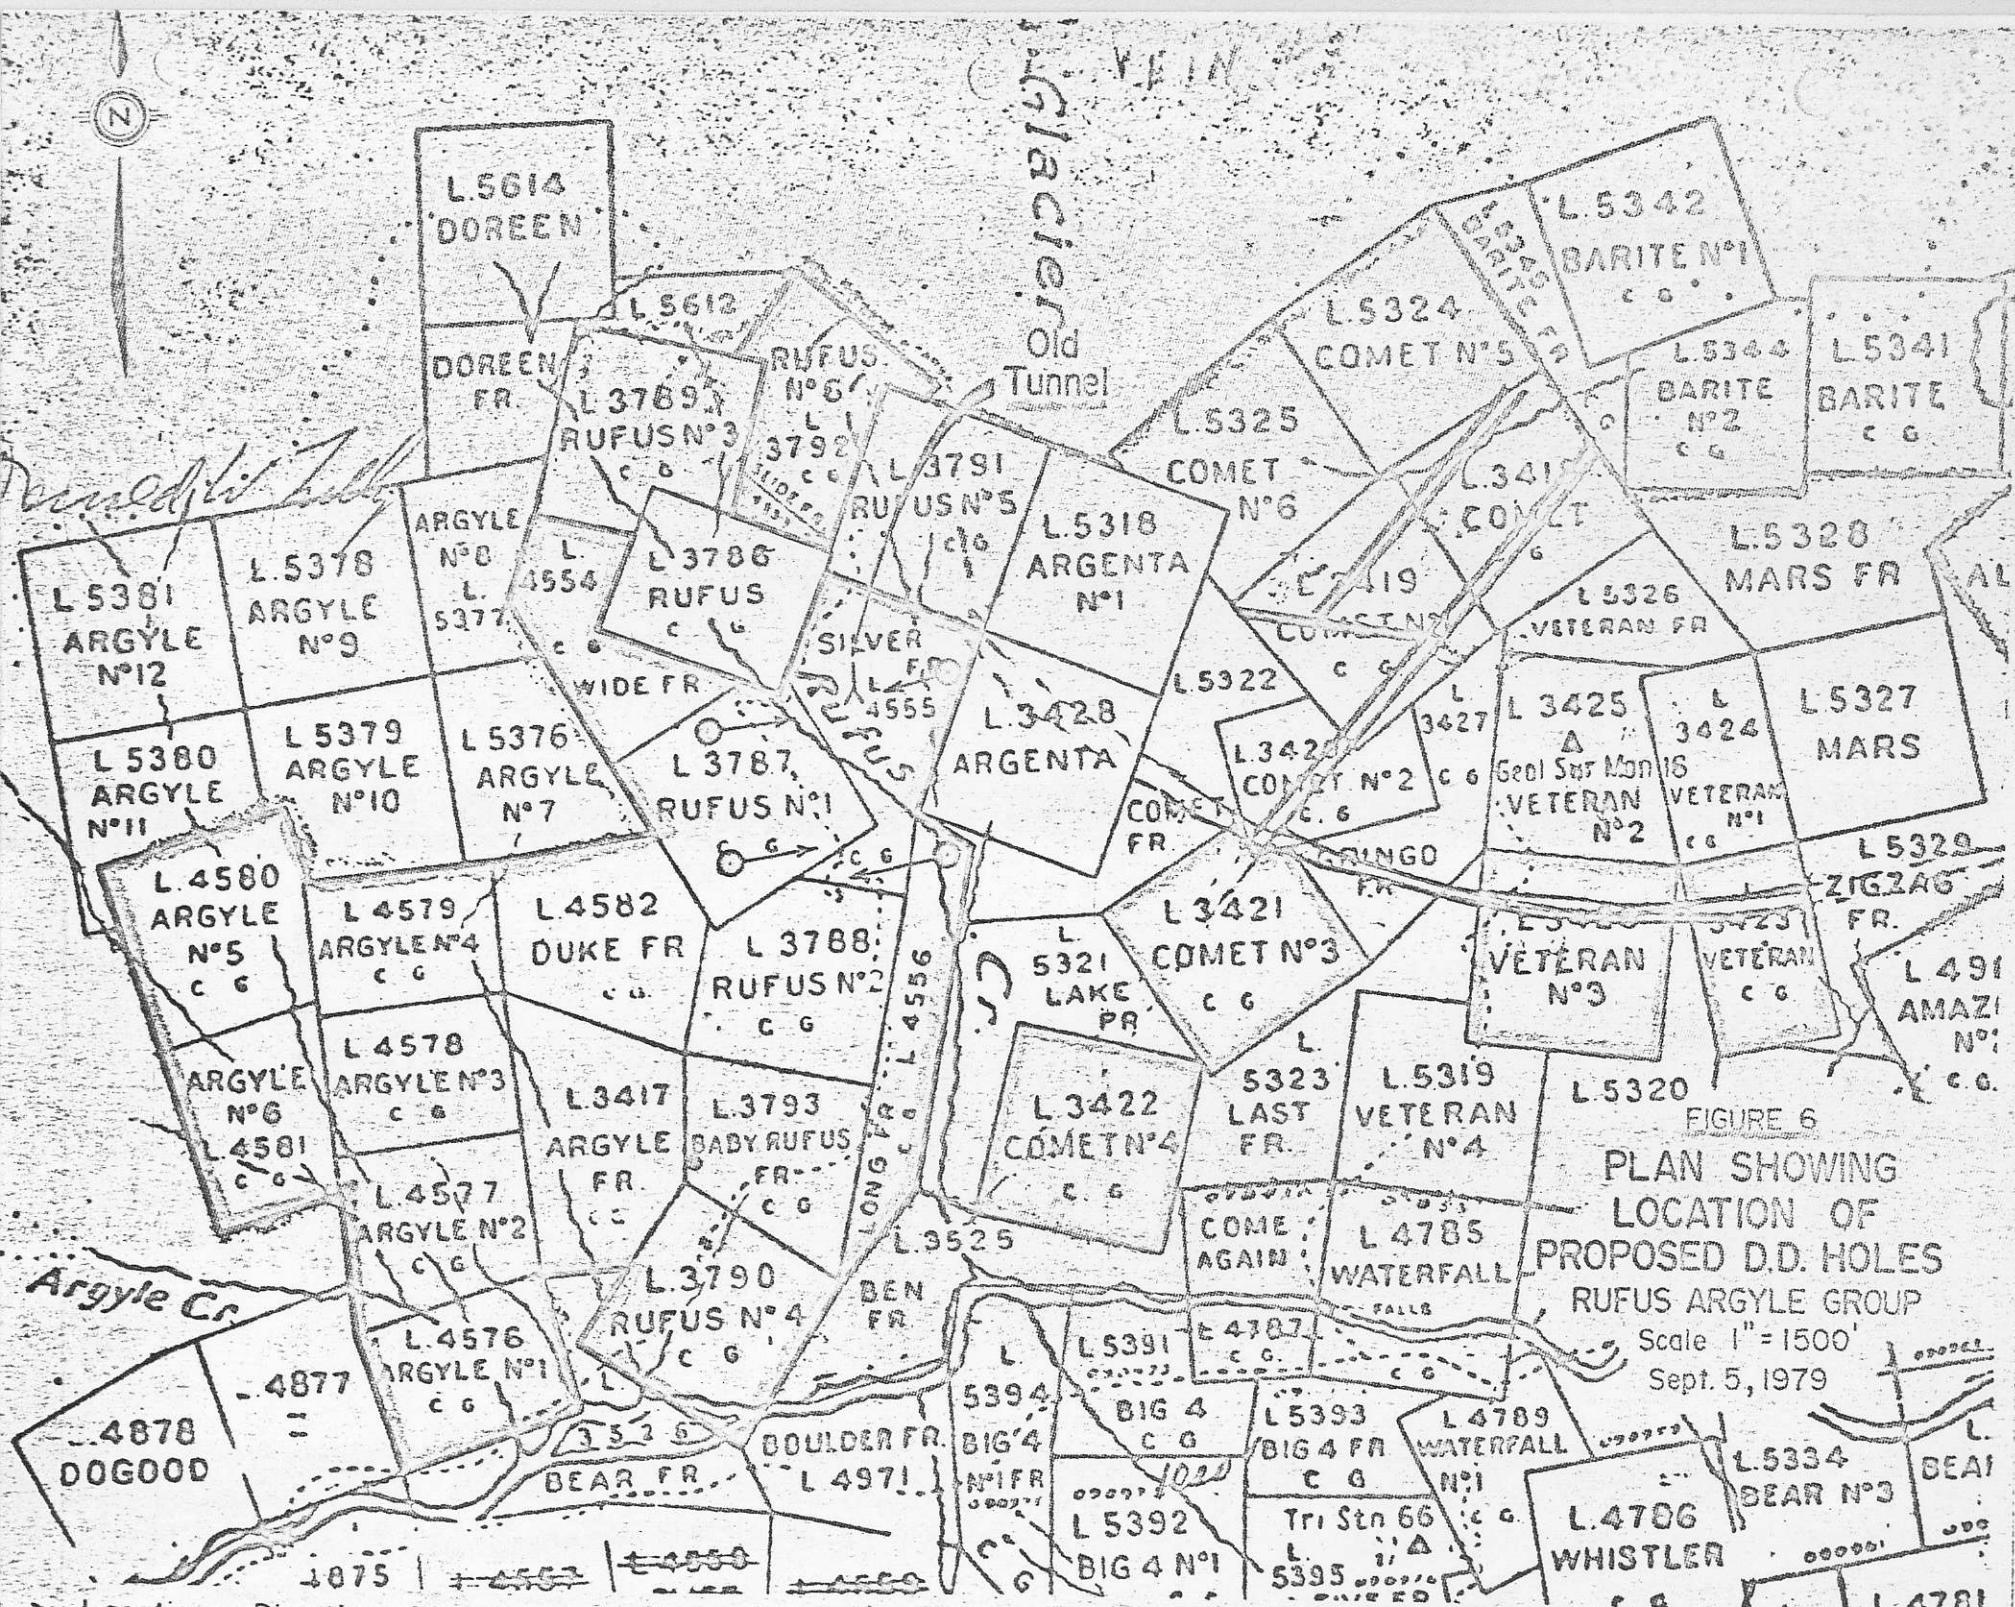

It is proposed a geologist and helper map the old workings on the Gold Cliff and Rufus-Argyle claim groups.

It is recommended that the mineralized quartz vein structures in the old workings on both the Gold Cliff and Rufus-Argyle properties be tested by diamond drilling. No evidence of previous drill testing was observed by the writer during the field examination.

It is proposed that the recommended drill test be supported by helicopter transport rather than attempt to construct a tractor road to the property.

ESTIMATED COST OF THE PROPOSED WORK PROGRAM

The location of the diamond drill holes proposed on the Gold Cliff and Rufus-Argyle claim groups are shown on Figures 5 and 6.

Geological mapping of the Gold Cliff
and Rufus-Argyle claim groups \$ 5,000

GOLD CLIFF

1. Construction of four drill site locations, use of a gas-powered rock drill, timber, supplies and helicopter \$ 4,800
 2. To diamond drill four holes of BQ core size wireline drilling and each hole 250 feet in depth (4 x 250 = 1,000 ft. x \$25/ft.) 25,000
- Fuel, mobilization and demobilization 6,000
- Helicopter transport of men, fuel and supplies to job from Stewart daily (2½ hours x 20 days x \$390/hr.) 19,500
- Crew accommodation, travel, supervision, core-handling, assaying and engineering evaluation @ 15% of \$55,300 8,295
-
- Estimated cost 63,595

RUFUS-ARGYLE

1. Construction of four drillsite locations
- Use of gas-powered rock-drill, timber, supplies and helicopter 4,800
2. To diamond drill four BQ wireline holes, each hole 250 feet in depth (4 x 250 = 1,000 feet x \$25/ft.) 25,000
- Fuel, mobilization and demobilization 6,000
- Helicopter transport of men, fuel and supplies to and from jobsite and Stewart daily (3 hrs. x 20 days x \$390/hr) including moves between drill sites 23,400
-
- Carried Forward \$59,200 68,595

Brought Forward	\$59,200	68,595
Crew accommodation, travel costs, supervision, core-handling, assay- ing and engineering evaluation @ 15% of \$59,200	8,880	
Estimated cost		68,080
Estimated total cost		\$136,675

Respectfully submitted,

Donald W. Tully

CERTIFICATE

I, DONALD WILLIAM TULLY, of the Municipality of West Vancouver, Province of British Columbia, hereby certify as follows:

1. I am a Consulting Geologist with an office at Suite 102, 2222 Bellevue Avenue, West Vancouver, British Columbia.
2. I am a registered Professional Engineer in the Provinces of British Columbia and Ontario.
3. I graduated with a degree of Bachelor of Science, Honours Geology, from McGill University in 1943.
4. I have practiced my profession for thirty-four years.
5. This report dated September 5, 1979 is based on a personal knowledge of the area from work done in 1973, 1974 and 1975, and from a personal field examination on August 13, 1979.
6. I have no direct, indirect or contingent interest in the Gold Cliff and Rufus-Argyle claim groups or the securities of Kingdom Resources Ltd., nor do I intend to receive any interest.. .
7. Written permission is required from the writer to publish this report in any Prospectus or Statement of Material Facts.

DATED at West Vancouver in the Province of British Columbia this 5th day of September, 1979.

Donald W. Tully, P. Eng.,

Barfrett - 1-14152

25th January, 1967

The Directors
Crest Ventures Ltd
Suite 10 - 558 Howe Street
Vancouver, B.C.

Gentlemen:

It has come to my attention that an omission was made in our summary report dated 13th January, 1967.

During the month of August, 1966, Mr. H. Tibbo examined a showing on the Rufus # 6 claim. This showing is reported to have been observed by a prospector in 1963 under the direction of Mr. F. White, consultant.

A rock slide has apparently exposed the vein, however, a cliff overhangs the vein making working conditions difficult and unsafe.

The vein dips into the mountain at +30° and is exposed for a distance of 30 feet horizontally and 50 feet up-dip. The vein itself has a width of about one foot where it is exposed above the slide debris, however the footwall of the vein is mineralized with argenticous galena and sphalerite for an additional 8 feet.

Because of the unsafe working conditions at the site only grub samples could be obtained, one of which assayed 265.9 ounces of silver and 65% lead.

Further work could not be carried out because of the lateness of the season, however a thorough examination of this important discovery should be made as soon as conditions permit. This work should consist of detailed sampling by trenching and diamond drilling to determine the extent of the mineralized zone.

Yours very truly,

A.G.A. Howe & Associates Ltd.

W.G. Timmins.
