

104-P-3**KIRK**

\*\*-----\*\*

- Location** Liard Mining Division, 48 km SE of Cassiar and 86 km NE of Dease Lake.
- Deposit Type** Copper, lead, zinc and silver occurs in silicified and carbonatized (shear?) zones adjacent to a schistose metavolcanic-carbonate contact.
- History:** The Kirk property was discovered prior to 1967 and an airstrip, an access road and a trailer camp were constructed to the property.
- 1968** - North Central Minerals carried out geological, soil sampling and ground EM surveys on the property.
- 1969** - Cry Lake Minerals conducted geological and soil sampling programs and an IP survey followed in 1970 by 509 metres of diamond drilling in 8 holes. No record of this work exists. No drill core is known on the property.
- 1978** - Esso Resources completed ground EM, magnetometer, rock, soil sampling and geological surveys.
- 1980** - Keystone Exploration carried out airborne and ground EM surveys. Diamond drilling was recommended.
- 1994** - The Kirk property was staked by the Predator Syndicate.
- Resource** Sulphide mineralization comprising seven occurrences ranging from 1 to 5 metres in width, but averaging 2 metres, occurs over a total length of 1050 metres. Chip samples taken across 3.0 metres in occurrence B assayed 2.76% Cu, 1.48% Zn, and 1.58 opt Ag.
- Sampling in 1994 confirmed the previous results and outlined further soil anomalies. Mapping has indicated a possible volcanogenic or sedimentary exhalative origin for the mineralization.
