Sept 30/81

Report from Esso - Charlie Aird

re: REB

664-4023

Crew spent 1 month on Reb

- grid
- mapping
- geochem.

2 anomalous areas outlined

- 1) quartz-barite veins (in older rocks?)
- 2) Pb/Zn geochem spatially related to pyrite zone Pb up to 1000 ppm.

Crew returned to anomalies

- trenched & sampled
- no sulphides observed & assay results being awaited

Conclusions - "In limbo at the moment" might be a transported Pb anomaly & trenching crew missed the sulphides.

N.B. appears worried about ~~the~~ lack of conclusive results in face of 30,000 payment due Dec 31/81.
