

TARGET PROJECT.

RESEARCH ON LUC SAMPLES NE OF TAKLA LK.
(MAP SHEETS 93M/16E, 94D/1E)

1. little sampling was done east of Aminicetta Creek.
2. Higher silver values of generally $1 \rightarrow 1.5$ ppm are associated with higher copper values of generally $100 - 500$ ppm near former Lion prospect.
3. An area of higher silver values of $1 - 1.5$ ppm occurs without associated copper highs approximately 4 mi north west of the old Lion prospect in an area thought to represent thrust ^{ed} Susut form² overlying unconformably Triassic? volcanics.
4. A spot high of 9.8 ppm silver was never followed up near the south part of the map sheet. There is definitely a need for check sampling. If this value isn't a lab error, ground follow up should be considered.
