Re: Riverside and Imperial

Brief conversation with Mr. Bruno Goetting of Highland Bell Mines yesterday afternoon indicated Highland Bell carried out a sampling program on this property recently. Work was done by Wayne Murton and Ruben Versoza.

Results of sampling average 12 oz. Ag across 1.3'. No ready explanation was offered for the significant discrepancy between these results and (a) results of sampling by Goetting, Stephen and Bacon November 1967, (b) results of sampling recorded on assay plans of the property.

Discussion with Wayne Murton in the near future would be of interest.

The writer wonders whether the sampling was limited to the narrow band of galena sphalerite mineralization at the expense of the wider pyrite mineralization on the basis of Murton and Versoza experience at Highland Bell.
