Freddie Camp  
Aug 2-9, 1982

Aug 12, 1982

Cam: Aug 2-5  
Mary: Aug 2-5  
Alison: Aug 2-9  
Norman: Aug 2-9

Aug 3-4

① Survey on ridge completed  
stations 100-207, included mapping  
of outcrops - dykes, gtz veins  
as well as topographic features

Aug 4-7

② Stream surveyed and located  
Northern portion on claims shows  
little outcrop, but southerly portion  
passing camp has extensive outcrop  
~~as well as~~ Outcrops were mapped  
and located. Survey started from  
Station ① and tied in to ridge traverse  
to St (205) to within  $5^{\circ}30'$  (25m)

Aug 8

③ Sample lines 9W and 8W completed  
~~to~~ from 5+00S to 15+00S; ~~SW~~ line  
8W difficult to sample due to high  
moss + grass cover - very little outcrop  
was found to the east of the ridge  
dividing the claims.

Aug 9

④ Talus line completed from line 12W, 10S  
and ~~contoured~~ contoured on the west side  
of ridge for 12 samples at ~100m  
intervals

Aug 9

- ⑤ Prospecting to the southwest of claims toward Teepee ~~Pk~~ + glacier found extensive outcrop on westmost <sup>contact</sup> branch of Camp Creek. Although no ~~ore~~ was found a transition is apparent between the schist and a volcanic tuff. Six rock samples were taken two of pyrite mineralization in Schist, ~~and~~ three of pyrite and possible Arsenopyrite in volcanic tuff and 1 of fine grained intrusive with rusty weathering and pyrite mineralization. Recommendations depend upon Geochemical results.

Aug 10

- ⑥ Claim posts improperly located at  
 → 3W 2S moved to 4W 2S  
 → ? moved to 4W 3S

The weather was cool and cloudy during the beginning of the week followed by very cold temperatures and some fog near the end of the ~~week~~ week.

The camp site was satisfactory, although future camps may ~~choose~~ <sup>find</sup> a site further down stream ~~maybe~~ more desirable as there is greater protection from wind + rain.
