JUNE 13/82

With regard to sample numbers please add the letters NX to the numbers you are using to indicate the syndicate or project for accounting purposes. Hence your soil samples should be 82 NX E-47 on the sample bags + record sheets.

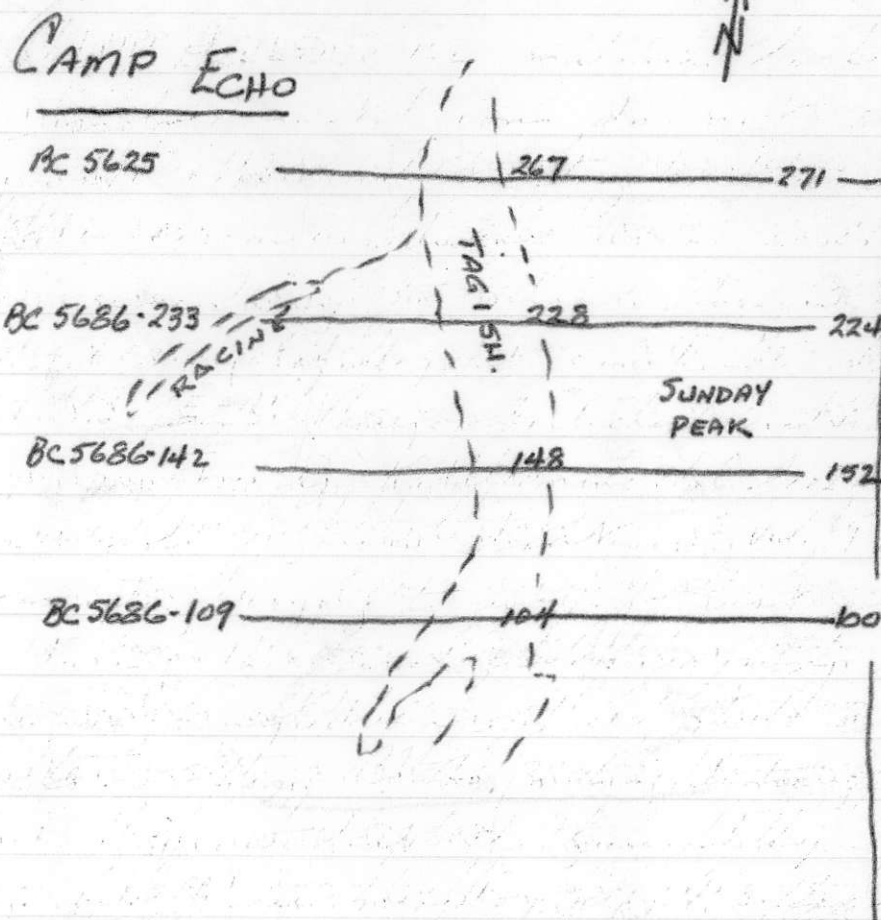

We have asked Cherner to supply our office with an original and one copy of all results. The procedure is to have Cherner hand deliver our results as soon as available. We can then get important results by phone and our office mails the second copy to the base. We will ask Mary to include an extra xerox copy of results for ease of the field crews.

It is likely the budget will be pretty well gone by the first week of September so if you want to get in some prospecting Henry we should plan on Sept 1-15 perhaps and see then what office work might be available. I have also sent a notice to some 28 companies indicating we may have people available for contract work ~~in~~ after September 1. Mary Webster and Louie Fasullo were the only ones I could place prior to June 1 but I will remind these companies in August and hope we can pick up some extra work.

We will plan on getting you to your suggested target in the Bennett caldera during the summer. Sounds like a good spot. Too bad more of the structure was not in BC rather than the Yukon as NX is limited to BC.

Conn

June 14/82

Photos covering Sunday Peak are provided but Bravo have the adjoining photos to the south and east.

Dupont have the HAKER claim to the southwest of Sunday Pk. Probably based on sediment sampling for Au.

Depending on snow conditions my first choice would be the vicinity of the intrusive on Sunday Pk at the volcanic contact - if too much snow I would try the intrusive area south of Sunday Pk.

Bravo should be finished with their photos by June 22 and they will be passed on to you.
