GEOLOGY: Middle Jurassic Hazelton Group pyroclastics and volcanoclastics overlain by Early Cretaceous (?) arenaceous conglomerates, sandstones and argillites. Sequence is cut by Late Cretaceous (?) felsite porphyry dykes and sills, then in the Paleocene extensively argillic altered, with lesser propylitization and minor silicification.

MINERALIZATION: Extensive volume of Cretaceous sediments and upper sections of the Jurassic rocks are pyritic (oxidized to 60m below surface) with minor amounts of arsenopyrite, sphalerite, chalcocite, chalcopyrite, galena, tetrahedrite, covellite and digenite. The As, Zn, Cu, Pb, Ag mineralization (along with Au) is concentrated near the Jurassic-Cretaceous volcanic-sediment contact. Mineralization is grossly controlled by faulting.
