## SUMMARY

From August 27 to September 2, 1969 Geo-X Surveys Limited conducted an induced polarization survey over an area of Mineral showings near the McConnell Lakes in the Omineca Mining Division, Province of British Columbia on behalf of Mr. B. Ginter.

The survey results showed only a slight increase in chargeability response in the area of the known showings. A depth probe over one showing indicated that the mineralization present at surface is in the form of a shallow discontinuous lens. The higher chargeability readings on line 0 + 00 to the south may in part be due to topography, or possibly to a change in lithology, to a rock type with a higher background chargeability.
