

Aug 1983

- ⑥ No placer gold found in west branch? - Stories are conflicting but JCS understands placer gold is confined to south side of main creek - as though two tongues of ice merged here - the one from south west carrying gold, that from west + north barren.
- ⑦ There may have been placer workings on this east flowing part of Rosella Creek but Normint was not working here.

- ① Old campsite of 5 years ago - Float boulder contains galena, cpy?, malachite in white siliceous matrix with small black angular siltstone fragments.
- ② No placer gold reported in this branch. Rusty brown basalt? dyke high on NE side.
- ③ Tractor cuts made between creek branches - no gold found 1983.
- ④ Gold reportedly found in dirty unsorted glacial till - much organic, clay, etc - JCS got no gold nor black sand from 2 pans. Doubts the existence of gold.
- ⑤ Small sinkholes in flat area south of creek cut by bulldozer trench. Forest beds in sands and gravels slope north and easterly. Well developed. No gold found.
