- Water chemistry for Diamond Drilling specializing in core recovery and hole stability.
- Non-contaminating environmental drilling fluid replacements for drilling muds and cutting oils.

### Drill holes located at Nuspar copper bet

A series of drill holes has been located to test inferred extensions of mineralized zones and to explore adjacent anomalies at Nuspar Resources' copper molybdenum property in the Dease Lake area of Northern British Columbia, where preliminary estimates suggest 300,000,000 tons at 0.5% copper.

The results of recent geological, geochemical and geophysical surveys are now being reviewed by Esso Minerals Canada, Nuspar's joint venture partner in the project. Nuspar must spend the first \$113,000 on this season's work to maintain its 40% interest. Further

expenditures would be shared on a 60-40 basis with Esso.

In the annual report for the fiscal year ended July 31, 1979, President H. S. Aikins notes that the company raised \$392,000 during the year to spend on exploration (done mainly through underwriting and best efforts offerings).

The company has spent \$176,000 on exploring the Kipawa property in Western Quebec, as well. Although uranium was initially sought at the property, a new zone of uranium mineralization has been found with significant rare earth elements.

Additional surface and underground mapping and diamond drilling are being conducted at the Cave Valley silver prospect near Ely, Nev.
