NEWS RELEASE

November 4, 1987

The company is pleased to announce that a six hole diamond drilling program has been completed at its Indata property located north of Fort St. James, B.C. The drill program was designed to test a recently outlined geochemical and geophysical target. All six holes intersected a quartz-sulfide structure varying between 14 and 24 feet in thickness. The target structure consists of alternating bands of quartz and massive sulfides and is open at both ends of the 120 meters of strike length tested and is open to depth. Assays are expected within two weeks time.
