NEWS RELEASE

Diamond Drilling Results Expand Molybdenum/Copper Porphyry Mineralization Within the Camp Zone Mac Property, Babine Lake Area, Central British Columbia

Spokane Resources Ltd. has compiled drill results from the central or Camp zone, one of three areas of molybdenum/copper mineralization currently known within the Mac property, located 40 kilometres southeast of the Granisle and Bell copper porphyry deposits. Spokane is currently one of several exploration companies conducting exploration and development drilling within the Babine Lake area of central British Columbia.

Recently completed drill holes 95-14, 95-15, 95-16 and 95-17 were located to extend zones of molybdenum and copper mineralization originally discovered in 1989 by Rio Algom Exploration Inc. This drilling has defined higher-grade mineralization in altered and silicified volcanics at the contact of a mineralized quartz monzonite porphyry intrusive. Two distinct molybdenum/copper zones of significant grade and tonnage potential have been defined. Both zones are open along the contact and outward from the intrusive.

The eastern zone appears to be continuous along the eastern contact of the quartz monzonite for at least 400 metres, has a width of at least 100 metres, and has to date been intersected by drilling to a vertical depth of 100 metres below surface. This zone has been defined by drill holes 89-04, 89-11, 95-14 and 95-15. The average of mineralized core intervals considered to comprise this zone is 0.09% Mo and 0.14% Cu with the best interval in drill hole 95-15 of 137 metres (450 feet) averaging 0.125% Mo and 0.176% Cu.

The northern zone has been defined by drill holes 89-12, 95-16 and 95-17. It is continuous for approximately 200 metres along the northern contact of the intrusive, has a width of at least 100 metres, and has been intersected by drilling to a depth of 100 metres below surface. The average of mineralized core intervals considered to comprise this zone is 0.11% Mo and 0.12% Cu, with the best interval in hole 89-12 of 72.2 metres (237 feet), averaging 0.201% Mo and 0.21% Cu.

Spokane plans a further 2,000 metre diamond drilling program for January and February of 1996. This program will focus on further defining the north and east zones of mineralization within the Camp porphyry system. All season logging roads are now within three kilometres of the Camp zone. It is expected that road access will be available in time for the commencement of the program. Spokane Resources Ltd. has the right to earn from Rio Algom Exploration Inc. a 60% working interest in the Mac property, while spending \$2 million on the property.

ON BEHALF OF THE BOARD
