

trenches in an area measuring 300m by 300m. Based on the assay results from the trenching and 1988/89 drilling, the company believes a target of 20-30 million tonnes of low-grade (0.03-0.06 opt Au) gold exists.

10) Golden Bear: Wheaton River Minerals Ltd. has announced a geological resource of 152,945 tonnes grading 20.5g/t Au, based on a 12g/t Au cutoff. Further drilling is required to put some of these into a mining category. The recently initiated feasibility study by Strathcona Mineral services has been expanded to investigate the viability of processing the higher grade material from the oxide zones (Ursa and Kodiak A deposits) in the existing mill, while processing the lower grade material utilizing heap leach extraction methods. Strathcona is investigating the feasibility of mining the Ursa deposit by open pit methods, rather than by underground. 32 trenches and 18 drill holes outlined several mineralized areas in 1995, particularly to the west of the Kodiak A zone, in carbonate rocks. A number of excellent targets have been outlined for next year.

11) Hearne Hill: Booker Gold Explorations Ltd. is on its 4th hole of NQ-sized drilling. Copper mineralization is reported to depths of 1000ft. Both porphyry-type and breccia-type mineralization is reported. [TGS Comment: desperately need to see plan/section of drilling pattern].

12) Hed: Amcorp Industries Ltd. and Verdstone Gold Corp. plan to drill this moly prospect, 10 miles south of the Crow-Rea prospect, in 1996.

13) Indata Lake: Eastfield Resources Ltd. has just completed a trenching
