Harmony Gold- a significant gold intersection was obtained in the most northerly of 4 step-out holes, drilled in December. The intersection (10.07 g/t Au over 9.98 m) is 270 metres north of the Specogna deposit and in the ore-controlling Sandspit fault, 60 metres below surface. Gold is in the same dacite dike that forms the footwall to the Specogna deposit.

Smithers Exploration Group talk- Will Tompson described the Del Santo VMS project to an audience of 25-30.

John Chapman, mining engineer/promoter, made a presentation to Mines office staff on a proposal to high-grade the **Yorke-Hardy** moly deposit and truck run-of-mine ore to the Endako mill (7 years at 2000 tons/day).
