FOR IMMEDIATE RELEASE
February 8, 1983

Significant results have been obtained from the trenching and stripping program now in progress on the Company's Sylvester K gold discovery near Greenwood, B.C. This program which is systematically exposing the higher grade hanging wall section of the massive sulphide zone has now extended the strike length to 600 feet and the zone is still open at both ends.

In the most southerly trench, the total width of the zone has not yet been fully exposed. An initial 7 foot channel sample of massive sulphide material assayed 0.316 oz/ton gold and 0.46 oz/ton silver. In trench #6 to the north previously reported results showed this zone to assay 0.26 oz/ton gold across 18 feet, including an 8.2 foot section assaying 0.33 oz/ton gold. This recent work is confirming the homogeneous character of both the structure and grade of the deposit.

The sulphide zone is overlain by an oxidized iron cap gossan. In the most southerly trench, a six foot by 2 foot panel sample of this iron cap material, assayed 3.86 oz/ton gold and 1.79 oz/ton silver. This is the first indication of possible bonanza grade mineralization on the Sylvester K, although similar values were reported from the nearby Brooklyn and Stemwinder deposits in the early years of mining in the Phoenix Camp.

In the most northerly trench the main zone has just been exposed and is currently being sampled. The massive sulphide body here is wider than in any other trench on the property to date, measuring over 20 feet in width. The iron cap in this trench is about 8 feet thick and at least 30 feet wide.

The program of trenching and stripping is continuing and will be followed by diamond drilling.

Kettle River has the right to maintain a 49% interest in this property with the remaining 51% owned by Noranda Exploration Company Limited.

On behalf of the Board

KETTLE RIVER RESOURCES LTD.
