Diamond drilling to date has outlined a large epithermal gold system over an area of 900 m (east-west) by 500 m (north-south). Within this system a central zone contains "economic gold mineralization". The zone has been drilled over a strike length of 400 m and a down dip extension of 150 m.

All holes were drilled in the main mineralized zone. Drilling is continuing according to plan. Further results will follow shortly.
