Gentlemen:

Some time ago you were good enough to provide us with about two inches of one of your drill cores. We have made a polished section from this sample. On examination we have found in it both hessite and electrum. Electrum is an alloy of gold and silver. Without more material we cannot tell the proportions of gold and silver present. However, what is interesting is that hessite and gold - or electrum - are also found in the mineralization at both Pellaire and in the Charlie Vein in the Tchaikazan.

Good luck with your future efforts.

Yours sincerely,

Harry V. Warren, Hon.Prof. Dept. of Geological Sciences.
