KINGSVALE RESOURCES LTD.

VALE PROPERTY - SUMMARY

The Vale property is located 45 km southwest of Peachland in southern B.C. within NTS map area 92H/9W. Good logging roads access all parts of the property from Peachland, Princeton and Merritt. The claim block comprises 185 units with anniversary dates in August, 1991.

The property covers rolling hills with elevations ranging from 900m to 1500m. Two south-flowing creeks, Siwash and Spukunne, cutting the eastern claims have steep-sided rocky canyons. Several large clear-cut blocks are present. There is moderate bedrock exposure in most areas.

Government geological mapping shows the property to be underlain predominantly by granite batholith with Nicola volcanic rocks underlying the western tip. A major lineament trends southwesterly along Trout Creek through the Bank property (FFD) and projects through the Vale claims. Gold soil geochemical anomalies along, and parallel to, this lineament on the Dill and Bank claims extend to the northern Vale claim boundary in four different areas.

Very few reconnaissance samples have been collected from the Vale area. Some weak copper and gold stream sediment anomalies are evident on the western claims. 15 Au
70 Cu

The areas of best economic potential may be along the trends of gold soil anomalies and linear structures projected southwest from the adjoining properties, and near the intrusive-volcanic contact on the western Vale claim. Private property on the eastern edge of the claim block will prohibit a small area from surface exploration. An area of unstaked ground underlain by Nicola rocks west of the property should be evaluated, and additional claims added if warranted.

One year assessment for the Vale property would require an expenditure of \$18,500 in 1991. Proposed work for the property consists of an estimated 4600 soil samples on 200m by 50m lines and 1600 fill-in soils on 50m by 50m lines for a total 6200 samples at an estimated cost of \$100,000.

Respectfully submitted
