

Annual Mines report 1918, p. K52
350 ft. below Diamond Claim on Lucky Seven group
E.F. G.H. group now called

801423

This group of four claims is owned by a Terrace syndicate. The claims are situated West of and adjoin the Lucky Seven group. The showing consists of a small, up to 2 ft. in width, flat quartz vein exposed along the face of a granite bluff. The quartz is mineralized in oxidized seams with small amounts of chalcopryrite carrying a little gold and silver values. The granite along the vein, in places altered to nearly straight quartz while in other places, it is nearly pure hornblende, and epidote which in places carry a little chalcopryrite. The vein appears to strike about N 60 E. and dips 20 degrees to the West, corresponding closely with the free gold vein of the Diamond Claim, above.

A crosscut of 73 ft. in length was run from the surface to the vein and a drift of 17 ft. on the vein, in which no values were obtained; consequently the work was stopped.

The tunnel is at elevation 3350 ft. or 350 ft. below the showing on the Diamond Claim. The finding of Gold in such a vein is purely a gamble. It would have been much better work to have drifted the total 90 ft. on the vein instead of doing the 73 ft. of dead work.
