ThiTerrain Conditions and whi Hazards

SOL

le,d,e This map delineates areas of Nun potential terrain hazards as well of as areas where terrain characteristics af1 are such that their properties should be as known prior to development activities.

le,d,e 1. Interpretive map-units are derived from the Terrain Map and indicated by numbers (1-10 in this case); particular hazards and conditions are shown by the following symbols:

Hazards

- A. slope instability
- Terrain Conditions
- B. erosion
- a. high water table b. near-surface see page
 - c. restricted subsurface drainage

- d. adverse topography
- e. shallow depth to bedrock
- deep organic deposits f.

Figure 5 Potential Aggregate Sources

This map outlines terrain units which constitute potential aggregate sources for construction purposes. Numbered units are grouped on the basis of terrain characteristics which may affect the potential of the material as an aggregate source.

- Mainly fluvioglacial materials may be poorly sorted (fine sandy to coarse gravelly texture) but thick deposits are usually well drained.
- 2. Raised fluvial terraces and fans gravelly texture and good subsurface drainage. Thickness may be limited by presence of underlying bedrock and areal extent may be limited by present-day stream channels.
- Thick colluvial deposits rubbly to blocky material is well drained where it accumulates as fans and aprons at the base of bedrock slopes.
