REDFERN LAKE - JOINT VENTURE

I enclose copies of an A.F.E. for the above project the text of which was transmitted by telex, together with the cold extraction results for zinc carried out on the Redfern Lake samples and an overlay plot of same for inclusion in Vestor's report.

I think you will agree that these results tend to verify the anomaly as residual there being a relatively small proportion of hydromorphic zinc in respect to the total zinc content. The contour configuration is also as one might expect with a general trend of higher percentage values just downslope of the total zinc anomaly and local highs corresponding with the marked drainage.
