FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
107.90 TO 168.60	DACITE (FP) FLOW/DOME «DAC FL/DOME»	Colour: medium green Grain Size: f.gr. 7-10%, 1-2 mm whitish, faint ghost like fsp cryst. locally absent, and patchy fine mafic laths in a green aphanitic groundmass; massive, locally fragmentally textured with increased bleaching and py stockwork			«wk Py Stkwk» Patchy, 2-4% diss. py and traces of diss. sp, cp, pyrite also forming patchy weak stockwork and fracture coatings Occassional vugs filled by well developed crystals of py, sp, cp, vugs and diss. sp declining downhole	Continuation of flow with py stockwork and open void sp-gn-cp Without sulphides, unit could be confused with FP dykes; FP dykes fsp sharper outlined, more euhedral
		108.9-110.8 -Andesite dyke -round, dark green, 1-3 mm round chlorite amygdule sharp upper contact, weak chill margin @ -lower contact in rubble	17		┤107.9-128.0├ «tr Sph,cp»	
				110.8-111.6 -0.5 cm wide white siliceous stockwork		
		120.9-123.0 -very rubbly core, green clay fault gouge from approx. 122.0-122.5				
		126.2-128.75 -fragmented dacite flow, lapilli and minor block size fragments		-weak grey bleached colour		
				130.55-131.25 -green epidote within pyrite stockwork	-strong pyrite stockwork, 5-7% py	
		142.75-146.4 -fragmented dacite flow as above		-moderate bleached appearance	144.25-145.6 -3-5%, locally 10% very fine pyrite with matrix to flow fragments	
		146.4-147.4 -coarse grained ash tuff, patchy hematite				
		146.9 Py Exhalite(?) -6 cm fine diss. pydrite, 15% mixed with hyaloclastite? sheared appearance			┤146.8-146.9├«Py Exh»	
				146.9-168.6 -patchy epidote within vugs and coating fractures		
		Lower contact in rubble				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
168.60 TO 189.60	QFP DYKE «QFPD»	Colour: medium green Grain Size: f. to m.gr. 3-5% subrounded, 1-3 mm quartz eyes, 7-8% white, 1-2 mm fsp crystal, 5% mm dark green clots/laths with very fine inclusions of white specks Massive, patchy crystal tuff appearance from 169.3 -171.3 Sharp lower contact @	25		<1% disseminated pyrite	Part of dacite flow/dome complex
189.60 TO 200.60	DACITE FP FLOW/DOME «DAC FL/ DOME»	Colour: med. green Grain Size: f.gr. Continuation of flow Last 20 cm weakly brecciated/fragmental		«gyp» 1 mm - 1.5 cm wide whitish translucent gypsum veinlets some with bleached selvages. Patchy mm wide epidote veinlets	<1% diss. py	
200.60 TO 212.45	AMYGDALOIDAL ANDESITE FLOW «AND FL»	Colour: dark green Grain Size: f.gr. 1-3% round to irregular chlorite amygdules, fairly massive with patchy brecciation with minor gypsum veining 200.6-202.0 -flow breccia with fragments of dacite flow 210.2-212.0 -weak to moderately brecciated, reddish grey silica stockwork		-weak chlorite throughout and as fracture coatings; 1-2 mm to 5 mm wide gypsum veining. Local diss. epidote, minor epidote associated with gypsum veining	«Tr sph cp» -<1-1% diss. pyrite, <1% sphalerite and trace chalcopyrite with gypsum veining at 203.6, 204.9 and from 206.2-207.2 210.2-212.45 -3-5% pyrite finely disseminated and forming weak stockwork separate from silica stockwork	«Anh»

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
212.45 TO 278.00	DACITE FP FLOW/DOME «DAC FL/DOM E»	Colour: med. green Grain Size: f.gr. 10-12%, 1-3 mm greenish weakly epidotized fsp crystals. Massive gypsum veinlets common		«wk epi» 1-5 mm wide gypsum veinlets common; wider veins have bleached selvages; weak epidote alteration of fsp crystals patchy weak hematite within fsp crystals		«Anh» 212.45-213.8 -<1-3% pyrite 214.4 -4 mm wide sphalerite veinlet remainder of unit: no sulphides
		╣253.7╠ «FLT @ 40 deg» -5 cm fault zone @	40	strongest gypsum veining from 245.9-253.8, gypsum veining less abundant downhole 259.15-278.0 -hematite associated with gypsum viens and locally within feldspars

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 3.05	Casing					
3.05 TO 36.05	QFP FLOW «DAC QP FLO W»	Colour: medium brown green Grain Size: f.gr. 5-7%, <1-2 mm angular quartz eyes and 10-12%, 1-3 mm subhedral to euhedral pinkish and orange white feldspars in a very fine groundmass; massive locally brecciated 27.4 -10 cm interval of <5 mm subangular brown and green QP flow fragments tightly packed; occasional interfragmental quartz eyes; 40 cm weak, brecciated texture below 27.4 m 32.2-36.05 -fragmental QFP, distinct fragments of QFP, some showing flow banding		Patchy brown surface oxidation, otherwise fresh		
36.05 TO 44.55	QFP BRECCIA «DAC FLBX»	Colour: medium green Grain Size: 5 mm - 3 cm and rarely over 10 cm subrounded to angular fragments of, aphyric, FP, QFP flow in coarse sand matrix of <3 mm grains of flow Contact between fragmental QFP flow and lower breccia occupied by 1.9 m, FP dyke		Local hematite within matrix	Trace grains of py within matrix	
44.55 TO 70.40	FP DYKE «FPD»	Colour: grey green Grain Size: f.gr. 5-7%, 1-2 mm euhedral to subhedral feldspar crystals; occasional <1-3 cm mafic xenoliths 54.0-55.3 -magnetic fine to medium grained diorite xenoliths 30 cm brown oxidized, brecciated zone at lower contact, fault?		Soft, pinkish zeolite? fracture coatings		

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
70.40 TO 99.30	QFP DOME «DAC QP FL»	Colour: beige grey Grain Size; f.gr. 10-12%, 1-2 mm pink white feldspar crystals and 5-7%, 1-5 mm angular, square and subrounded quartz eyes; grey aphanitic groundmass Massive, no brecciation textures as in previous QFP 73.2-73.6 -feldspar hornblende porphyry dyke cutting QFP		Occassional soft, pinkish mineral coating fracture surfaces		
99.30 TO 123.40	ANDESITE FP DYKE «FPD»	- Colour: medium green grey Grain Size: f.gr. 10-12%, 1-2 mm tan white subhedral feldspar crystals often with zoned appearance with chloritic cores; weakly magnetic; locally 3-4% mm chlorite altered phenos Weakly amygdalidal mainly at top of unit with irregular shaped 2-3 mm quartz amygdules Patchy, pinkish white zeolite filled cavities usually <1 cm; pat;chy weak brecciated texture 114.0-114.3 -green sandy andesitic interval 114.3-117.75 «FLT» -fault zone -rubbly core, some fault gouge; some core pieces of thinly bedded sandy green andesitic epiclastics 122.6 -30 cm screen of heterolithic volcanic fragment breccia Sharp lower contact				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
123.40 TO 137.30	AMYGDALOIDAL DYKE «MD»	Colour: med. to dark green Grain size: f.gr. Patchy, 10-12%, 1-2 mm grey silica amygdules occasionally coalescing, patchy 2-3% irregular calcite amygdules, patchy pinhead chlorite amygdules; <1-1% white 1-2 mm feldspar crystals -weakly magnetic 123.4-128.7 -dark green to green black finer chilled margin 125.05-126.05 -andesite crystal tuff and hematite stained lapilli tuff 128.7-130.3 -possible andesite flow, mottled grey and green colour, possible hyaloclastite 2nd intrusive pulse marked by chill margin 133.2 10 cm chilled lower contact			-weak very fine pyrite veining stock-work	
137.30 TO 145.25	ANDESITIC FP FLOW «AND FL»	Colour: mottled and speckled grey green Grain Size: f. to m.gr. Mottled appearance of green fsp phyric, weakly amygdular fragments in a grey siliceous stockwork; some grains within stockwork show a concentric building of silica around grains Weakly magnetic Irregular lower contact over 15 cm		«silica flooded» Weak preferential silica alteration of interblock hyaloclastite?	Trace pyrite	FP frags in hyaloclastite or brecciation and silica flooding of massive FP flow
145.25 TO 198.60	FHP DYKE «FHPD»	Colour: tan grey Grain Size: f.gr. 10-15%, 1-2 mm euhedral feldspar crystals, some zoned or with chloritic cores, fine <1-1 mm chlorite altered amph laths and abundant usually <0.5 cm speckled diorite xenoliths				Vuggy dyke margins with calcite - zeolite fillings

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		145.25-151.7 -2-4%, <0.5 cm irregular zeolite +/- calcite filled cavities 146.8-147.8 -mafic dyke; very fine dark green black chill margins, coarser green core, 1 mm calcite amygdules 175.7 -unit becoming quite vuggy; some vugs filled with white calcite; pinkish zeolites and occasionally chlorite Faulted lower contact @	25			
198.60 TO 207.45	FELSIC FLOW PEBBLE CONGLOM «OZC»	Colour: med. grey Grain Size: c.gr. Up to 6 cm, averaging, 1-2 cm grey and bleached subrounded felsic flow fragments, occasionally feldspar phyric, in a grey pyritic muddy coarse sand matrix; poorly sorted, matrix supported, locally fragment supported Rare, < 5 mm massive sphalerite fragments 203.15 -3 cm grey fault gouge 205.8-206.95 -fault gouge as matrix Last 30 cm, amygdaloidal basalt fragments		Bleaching and sericite alteration of fragments prior deposition	«Sph,py,ba Stkwk» 3-5% diss py. within matrix and locally rimming fragments where py may reach 10% <1% sp and cp diss. within matrix and diss within some fragments 199.8-200.3 201.3-201.6 soft white veining stockwork (barite) with elevated sp and cp diss. within stockwork, 1-2% sp, up to 1% cp	Identical to OZC in hole 85-3; lacking MS at top of unit
207.45 TO 208.55	BASALT BRECCIA «BAS BX»	Colour: medium to dark green Grain Size: f.gr. Angular block and lapilli sized angular fragments of chlorite-calcite amygdaloidal basalt with a hematite stained argillaceous matrix				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
208.55 TO 209.25	SILTY ARGILLITE «ARG/XT»	Colour: green black Grain Size: f.gr. Poorly bedded, contains <1-2 cm layers or large fragments of feldspar phyric XT or fiamme				Also known as the footwall marker
209.25 TO 211.90	DACITE AND BASALT LAP TUFF/ CONGLOM «DAC/BAS LT »	Colour: grey green Grain Size: c.gr. Up to 6 cm subroundeed fragments of FP flow and amygdular basalt, argillite fragments at top and patchy FP vitric fragments; hematitic argillaceous FP matrix at top of unit decreasing below 210 m <5 mm rounded fragments in last 40 cm; weak resemblance to OZC Lower contact @	33		Trace diss. py. within matrix increasing below 210.6 m Last 40 cm, <1-1% diss. py.	Debris flow
211.90 TO 225.70	«FPD»	Colour: maroon, green Grain Size: f.gr. 10%, 1-3 mm fsp crystals and occasional amphibole laths; vuggy, minor fillings of calcite 218.5-220.15 -screen of dacite lithic tuff, hematite altered matrix -lower contact in rubble				
225.70 TO 289.80	DACITE LITHIC TUFF «DAC LTH T»	Colour: light to med.green, maroon, orange green Grain Size: c.gr. Angular to subrounded lapilli sized fragments of green and maroon dacite FP flow, dark green FP vitric fragments (fiamme) in a weakly fsp phyric ash tuff matrix 225.7-230.3 -rubbly core 233.35 -15 cm green fault gouge 233.35-238.1 -orangish coloration to matrix; fragment poor				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		238.1-238.8 -dark green, weakly magnetic amygdaloidal mafic dyke 238.8-260.1 -light green colour, domination of light green soft feldspar phyric dacite fragments, minor siliceous maroon FP flow frags and dark green fiamme 265.45-269.25 -Mafic dyke: dark green, fine grained, massive, 1 mm calcite amygdules at upper contact, 1-2% white fsp laths in core of dyke; lower contact in rubble 286.9-289.8 -FP dacite fragments decreasing abundance, appearance of large angular amygdular basalt fragments		-moderate to strong clay alteration of light green fragments		
289.80 TO 295.10	BASALT DYKE «MD»	Colour: dark green Grain Size: f.gr. Massive characterized by 7-10%, 1-2 mm round grey siliceous spots = amydules; occasional <1-1 mm chlorite and calcite amygdules Lower contact in rubble				
295.10 TO 300.20	DACITE LITH TUFF «DAC LTH T» -	Colour: dark maroon green Grain Size: c.gr. Maroon grey feldspar phyric dacite flow fragments, subrounded, coarse sand matrix of flow materiat

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 3.05	Casing					
3.05 TO 21.20	QFP CRYSTAL LAP TUFF «QFP XT/LT»	Colour: speckled orange tan Grain Size: m. to c.gr. Abundant orange and white coloured 1-2 mm feldspar 3-4%, 1-2 mm quartz eyes, 2-7% 1-5 mm dark green chloritic vitrics and orangish aphanitic (FP) flow fragments up to 1 cm; massive, no bedding 18.6-21.2 -becoming finer grained, quartz and lapilli content decreasing				
21.20 TO 23.85	ARGILLITE «ARG»	Colour: dark grey black Grain Size: f.gr. Poorly bedded and laminated @ Iron stained (weathered) away from fractures	75		Patchy very fine grained diss pyrite	
23.85 TO 42.55	QFP TUFF BRECCIA «QFP TBX»	Colour: medium grey and speckled white green Grain Size: f. to c.gr. Block size angular fragments of fine grained grey ash tuff in a very coarse QFP matrix; matrix composed of 25-30%, 2-3 mm white fsp and up to 10%, 2-4 mm round quartz eyes set in a finer shardy ash matrix 27.0 -5 cm fault gouge 27.5 -4 cm iron stained fault gouge @ 32.55-32.95 -laminated argillite, possible fragment? 34.4-39.6 -(Q)FP crystal tuff, lapilli tuff; sharp upper contact argillite fragments from 39.0-39.1	60 55		39.3 -two <5 mm pyritic fragments	Coarse grained QFP usually seen in immediate HW to Zn exhalite argillites

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
42.55 TO 58.80	ARGILLITE, SILTSTONE, MINOR DAC AND ASH TUFF «ARG/SLTST/ ASH»	Colour: medium dark grey, light med. green Grain Size: f. to c.gr. Thinly bedded and laminated argillite and siltstone interbedded with occasional coarse grained intervals of dacite ash tuff, crystal tuff and volcanic derived sandstone 53.0 -10 cm pale green massive chert 42.9 -bedding @	 60		«Py lam» -occasional very fine grained pyrite rich laminations and pyritic muds; minor diss. pyrite within volcanic sandstones	
58.80 TO 70.60	INTERBED FINE SEDS & COARSE ASH TUFFS SST «SLTST/ASH/ XT»	Colour: grey, green orange Grain Size: f. to c.gr. Laminated to thinly bedded grey and green very fine grained silicified or cherty sediments interbedded/interlaminated with coarse grained orangish and green feldspar tuff/sandstones 67.4-70.4 -very coarse ash flow with dark green vitrics and up to 1 cm orange (potassic) fragments interbedded with finer seds Bedding: 59.9 @ 69.0 @ Lower contact in rubble	 75 68			
70.60 TO 96.10	DACITE ASH «DAC ASH»	Colour: medium green Grain Size: v.f.gr. Massive, aphyric, possible bedding at top of unit patchy coarser grained <30 cm intervals of fsp crystal tuff and ash tuff with dark green vitric grains Unit characterized by lighter green strong perv. 1 mm wide wormy stockwork		Patchy silicification probably a primary feature		Other holes in Trough area have a unit similar to this in the footwall but silica flooded dacite flow is not present here.

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		72.5-73.1 -possible bedded silicified ashes				
96.10 TO 159.70	DACITE ASH TUFF «DAC ASH T»	Colour: light to medium green Grain Size: f. to m.gr. Massive, aphyric ashes with occasional <5 mm orange lithic FP flow fragment gradually coarsening below 125 m; becoming more granular with the appearance of <5 mm dark green fiamme below 147.6 m 130.25-147.6 «pseudobx» -moderately developed pseudobreccia lighter green stockwork

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 32.92	Casing	Blocks and rubble of feldspar				Much difficulty collaring due to boulders
32.92 TO 80.77	Feldspar porphyry dike «FHPD»	Colour: green Grain Size: m.gr. Randomly oriented 3-4 mm feldspar phenocrysts set in a f.gr. matrix, massive -occasional vague mafic phenos - remnant hornblends? -also rare remnant mafic xenoliths up to 1 cm in size 51.21-54.25 -granodiorite dike or boulder in fault; biotite-qtz-fspar 62.50-63.50 -DAC ash ultra fine grain		Nil -weak epidote at base	Trace pyrite	29001 45.11-48.11 More likely boulder lodged in fault
80.77 TO 89.61	«DAC ASH ULTRA FINES»	Colour: drab green Grain Size: ultra f.gr. Upper ctc sharp, no hornfels, homogeneous, massive ash beds; occasional thin beds	35	Nil	1-3% py; sulphide mud at top of sequence, 5-10% ultra fine grained py	
89.61 TO 94.79	FELDSPAR PORPHYRY DIKE «FPD»	Colour: lt. green, speckled Grain Size: m.gr. Massive feldspar porphyritic chaotic organization of phenocrysts; rare mafic patches 94.79 -Fault		Mod. epidote attacking fsp phenocrysts	Nil	
94.79 TO 105.46	«DAC ASH» minor lap tuff	Colour: lt. green to drab green Grain Size: v.f.gr. to m.gr. Fine grain, massive ash beds with occasional thin		Upper portion affected by moderate to	2-3% py as laminae in ash beds and as	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		beds and laminae; minor lapilli tuff bed with vague clasts of feldspar porphyritic dome material 100.73-102.60 -sulphide mud 102.60-103.20 -Andesite Dike(?); stg. chlorite and epidote	40	stg. epidote	clots or patches in LT beds 100.73-102.60 -sulphide mud, 5% ultrafine grained pyrite	299002 99.60-102.60
105.46 TO 131.06	«FPD»	Colour: Grain Size: Feldspar porphyritic massive upper section has a fragmental look occasional mafic patches, xenoliths, pitted surface		Very weak epidote	1-3% diss. pyrite in upper section; minor narrow quartz veining carrying </- 5% coarse grained pyrite @ 122.1 125.5	
131.06 TO 143.72	«DAC LT, GM S» Dacite lap tuff, minor ash	Colour: green and white mottled Grain Size: m.gr. Felsic lapilli are vague - ghostly green shardy feldspar porphyritic fiamme show proferred orientation at occasional block/bomb of fsp porphyritic dome material have reaction rims; minor ultra fine ash beds 141.35 -Fault, gouge	50 55	Nil; hematitic cherty bands in upper 2 meters	Sulphide (pyrite) fragments <1 cm in size in LT beds 143.0 -c.gr. chalcopyrite in vug	Partially welded ash flow tuff 29003 137.4-140.47
143.72 TO 191.36	«DAC FL BX» Dacite flow flow bx	Colour: Grain Size: Feldspar porphyritic lapilli size fragments in a silicified matrix; monolithic fragment supported very rare foreign frags 151.18 -Fault		«m - stg si» Moderate to strong matrix silicification feldspars are weakly epidotized	1-2% disseminated pyrite 160.92 «Cp vn» -chalcopyrite veinlet 1 cm; 1 cm vein selvages	29004 155.5-158.50 In places resembles feldspar porphyry dike Matrix silicification gives fragmental

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
						appearance; silicification due to proximity to dike? 29005 186.59-189.59
		Lower ctc conformable at	90			
191.36 TO 196.22	«DAC LT, GM S»	Colour: striped dark green and white Grain Size: m.gr. Green shardy fiamme and interstitial cherty zones (remnant felsics?) preferred orientation welded in places	65	Nil	Trace - 1% py as clots on possible fragments	Welded ash flow screen
196.22 TO 217.37	«AND LTH LT» Andesite Lithic Tuff	Colour: green with lt. green pink & white patches Grain Size: m.gr. Contact sharp -distinctive highly altered pyroclastic; characterized by abundant white felsic lithics often with weak reaction rims; matrix supported; matrix andesitic; large patches or zones of epidote and potash alteration; notable pumaceous lapilli	48	«m - stg. epi» Moderate to strong epidote alteration also pinkish alteration - could be potash or barite	«tr. cp» ⌈210.10-210.80⌋ «1-2% cp» -chalcopyrite ocurs as disseminations within felsic lithics	«gyp» gypsum/anhydrite veins, frequent magnetic 29006 197.21-200.21 29007 214-217
217.37 TO 225.60	«DAC FL?» Dacite flow or early dike	Colour: grey green Grain Size: m.gr. Massive, fsp pophyritic; affected by gypsum veinlets; phenocrysts are poorly formed Lower contact	50	Nil	Trace pyrite associated with veins	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
225.60 TO 255.33	«AND BLT» Andesite block and lap tuff	Colour: green white and yellowish green Grain Size: m.gr. Spectacular white fragment breccia; heterolithic but felsics dominate; block and lapilli size felsic lithics dominate; frag-rich; felsics have well developed reaction rims; some fragments are vesicular or scoriaceous; fragments can be angular to bomb shaped		«m epi» Moderate epi	«gyp, tc. cp/sph» Gypsum/anhydrite veins throughout some felsic lithics carry galena and most chalcopyrite occur within or close to felsic lithics	«Mill Rock» Ubiquitous mineralized dome fragments 29008 227.7-230.7
		231.4-232.81 -Early andesite dike; tr.cp., strong chlorite			237-243 -tr-15 disseminate sphalerite usually within felsic lithics	16346 242.93-243.43 -trace geochem
		249.2-256.18 -hematized zone followed by bleached zone contains numerous barren banded quartz vein		⟦249.2-254.32⟧ «stg. hem»	⟦247.27-248.27⟧ «1-2% cp» -tr-1% sph in narrow qtz vein running parallel to c.a. and as disseminations	16344 -geochem trace only 247.27-248.27
255.33 TO 263.20	«DAC FL» Dacite Flow?	Colour: lt. green Grain Size: m.gr. Massive, feldspar phyric; ghostly phenos		255.33-256.12 -upper part bleached	tr-1% py, tr cp	Possible dike
		Lower contact, faulted 3 cm gouge		256.12-258.17 -chloritized remainder fresh		
263.20 TO 267.90	«AND LT» Andesite lithic lap tuff	Colour: green and yellow green Grain Size: Matrix supported fragments affected by pervasive epidote flooding		«stg. chlor» wk-mod epidote, strong chlorite	«tr. cp» -1-2% py associated with wormy qtz veins 266.25-266.82 -qtz veinlets (wormy) plus 5% py	
267.90 TO 280.25	«DAC FL» Dacite Flow	Colour: olive green Grain Size: m.gr. Massive, fsp phyric, fsp vague; cut by gypsum on anhydrite veins		Nil	1-2% py	Possibly an early felsic dyke gypsum veining

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		-cut by gypsum or anhydrite veins				-similar to 255.33 to 263.20
		Lower ctc, sharp @	70			29009 270.4-273.4
280.25 TO 320.00	«AND LTH LT » Andesite lithic lapilli tuff	Colour: green and yellowish green Grain Size: m.gr. Felsic(?) lithic rich; clasts have well developed reaction rims; some frothy scoriaceous frags; framework set in a f.gr. andesitic matrix; fragment rich but matrix supported Block and bombs are now vague and vesicles are filled with chlorite and occasionally base metal mineralization; some amygdules reach 5 mm in size		«m. chl» Epidote attacks felsic clasts and veinlet selvages Chlorite intensifies downhole	«tr-1% cp/shp» Chalcopyrite occurs as disseminations within felsic lithics as veinlets associated with sphalerite and disseminated in andesitic matrix Some vesicles filled with chalcopyrite and sphalerite	Well mineralized in upper portion 29010 291.08-294.08 29011 310.0-313.0
320.00 TO 333.00	«AND FL» Andesite Flow	Colour: dark green Grain Size: m.gr. Massive, amygdaloidal andesite flow; uninterrupted except for tuff bed at 325.50		«i chl» Intense chlorite amygdules are chlorite filled; epidote patches and vein selvage alteration	«tr sph» 321.3-322.3 -1 cm band of sphalerite quartz and 3-5% py [325.4-325.9] «tr-1% cp» -tr sph, tuffaceous horizon with numerous felsic clasts in siliceous matrix	Extreme chlorite 16345 321.3-322.3 29012 329-332
333.00 TO 387.71	«FPD» Felsic Dyke	Colour: lt. green Grain Size: m.gr. Massive, fresh, fsp porphyritic; fsp vague but up to 3 mm; shattered appearance, rare patches - poss. xenoliths		Nil	Trace to 1% pyrite	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		⌊335.75⌋ «FLT»

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 6.10	Casing					
6.10 TO 9.10	ANDESITE ASH TUFF, LAP TUFF «AND ASH/LT»	Colour: med. green Grain Size: Coarse, granular ash, patchy finer ash, bedded @ 65-70 deg to c.a.; occasional dark green fiamme, rare epidote altered creamy white felsic fragments up to 3 cm		Patchy epidote alteration of felsic fragments	Patchy fine diss. pyrite 7.25 -3-4 mm pyrite and pyrite rich frags	
9.10 TO 14.00	DACITE LAP TUFF «DAC LT»	Colour: mottled whitish green Grain Size: c.gr. Creamy grey, marroon, and reddish green angular felsic fragments averaging less than 1 cm but occuring up to 6 cm; patchy areas of reddish white strong silicified mottled zones - possible chert fragments or chert beds?, patchy coarse granular ash tuff 11.0-11.1 JASP -red jasper fragments			<1-2% diss. py. mainly within frags occasionally diss. with matrix and within ash tuff 11.0-11.1 «Jsp+Py» -5% diss. brassy py 11.6-11.8 -3-4% py diss and as 2-3 mm frags	
14.00 TO 17.50	ANDESITE LAP TUFF «AND LT»	Colour: medium green Grain Size: f.gr. Coarse ash to fine lapilli sized andesite frags, occasionally amygduloidal, and occasional felsic fragments up to 3 cm with 1-2 mm wide reaction rims 14.0-14.25 -red jasper fragments			<1% diss py,; felsic fragments often contain fine diss. py 14.0-14.25 «Jsp+Py» -2-3% coarse brassy py	
17.50 TO 29.50	ANDESITE FLOW «AND FL»	Colour: medium to dark green Grain Size: f.gr. 5-7% green epidotized fsp phenocrysts, massive		«mod ep» Moderate epidote as epidote altered	«tr. sp» Trace sphalerite within epidote	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		23.9-25.6 -screen of andesite lapilli tuff		fsp crystals, occasional epidote veins and occasional round patches usually <1 cm, some with diffuse edges	veinlets and occasionally within epi. patches; patchy diss. pyrite 20.4-20.95 -7-8% very fine diss. pyrite	
29.50 TO 52.00	ANDESITE BLK. AND LAP TUFF «AND BLT»	Colour: mottled creamy medium green Grain Size: c.gr. Block and lapilli size, epidote-calcite altered creamy white felsic fragments, some quite frothy and more indistinct occasionally amygdaloidal andesite lapilli 51.7 -4 cm wide green fault gouge Lower contact in rubble		«str. ep-calc» -strong epidote-calcite alteration preferentially within and adjacent to felsic fragments, some epidote patches up to 40 cm wide	«tr sp» -trace sphalerite mainly as rare grains within white felsic fragments 29.6 -3 cm wide epidote vein with 2-3% sp and 3-4% py 51.5-51.7 -3-5% brassy py, up to 1% cp	
52.00 TO 121.20	DACITE FLOW /DYKE «DAC FL/DYKE»	Colour: light to medium grey green Grain Size: f.gr. 7-10% white euhedral to subheral 1-2 mm fsp crystals and crystal clusters. Massive but with a fine white pervasive stockwork which is partially calcite 75.5-76.2 -screen of dacite lapilli tuff Lower contact possibly faulted		[52.0-77.0] «wk ep» -weak epidote as 1 mm diss. grains (after mafics?) and rare veinlets and 5 mm patches (xenoliths?) -epidote decreasing below 77 m	-<1-2% diss. py, fine dark py smeared along breakage surfaces; patchy 2-3% py -1-2% diss. pyrite, tr. diss cp 76.7-77.7 -trace sp 88.5-92.5 -trace diss. sp.	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
121.20 TO 122.80	ANDESITE ASH «AND ASH»	Colour: dark green Grain Size: f. to m.gr. First 30 cm abundant <1 cm rounded felsic frags; remainder of unit ash with occasional <1 cm amygdaloidal andesite fragments		Weak calcite as calcite clots in first 10 cm and occasional 1-3 mm throughout	1-2% diss. py	
122.80 TO 126.15	ANDESITE LAPILLI TUFF «AND LT»	Colour: mottled light and dark green Grain Size: Bleached felsic fragments some with diss sp and epidote corroded andesite frags in a strong epi. and calcite altered matrix		«str. ep» -strong pervasive epidote as matrix to fragments and alteration of fragments including massive sphalerite frags	«MSph Frgs» -occasional epidote altered massive sp frags up to 1 cm, minor sp diss within felsic fragments, <1% py	
126.15 TO 133.00	ANDESITE FLOW BX «AND FL BX»	Colour: dark green Grain size: f.gr. Faintly outlined pinhead chlorite amygdule frags, occasionally silicified; patchy hyaloclastite		«wk. sil» Patchy weak silification of andesite fragments imparting grey colour to some fragments; patchy grey siliceous veining/stockwork	«5-7% py, <1-1% cp» 5-7% py diss., 5 mm clots, and minor veinlets <1- locally 1% cp diss and minor veinlets CP veinlets cross-cutting lower contact	Could this correlate with the ore hosting flow breccia in the pit area?
133.00 TO 136.60	DACITE FP DYKE? «FPD?»	Colour: medium green Grain Size: f.gr. 5-7%, 1-2 mm green epidotized fsp in an aphanitic green matrix, massive 135.9-136.3 -screen of dacite lapilli tuff with dacite flow fragments		-epidote alteration of feldspars		
136.60 TO 150.45	(Q)FP DYKE «QFPD»	Colour: Grain Size: f.gr. 10-12%, 1-3 mm greenish white euhedral feldspars and patchy 1-2% angular and rounded quartz eyes,		Weak gypsum veining, weak epidote alteration of feldspars		«Gyp»

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		some which may be amygdules; occasional <1-2 cm and up to 4 cm green mafic xenoliths faulted lower contact with chloritic gypsum veining @	20			
150.45 TO 176.20	DACITE FP DYKE «FPD»	Colour: light to med. green Grain Size: f.gr. Massive, very similar to previous unit but fsp are fresher and quartz eyes are rare ┤175.1-175.3├ «FLT» @ 25 -fault zone; green milled rock, carbonate-gypsum veining parallel to clay slips @	25	Weak calcite +/- gypsum veining	<1% diss. py	
		175.3-176.2 -Andesite flow?			-5% diss. py.	
176.20 TO 188.80	«QFPD» QFP Dike	Colour: light to medium green Grain Size: f.gr. 7-10%, 1-2 mm euhedral fsp, patchy 1-2%, 1-3 mm qtz eyes; occasional <1-2 cm dark green mafic xenoliths; sharp lower contact @	45			
188.80 TO 195.55	ANDESITE LAPILLI TUFF «AND LT»	Colour: dark green Grain Size: f.gr. Indistinctly outlined andesitic fragments, occasionally chlorite amygdaloidal and <5% marroon and grey FP flow fragments up to 2.5 cm 191.75-192.7 -QFP dyke; 3-5 cm wide dyke margins of quartz and fsp crystals in a dark green glassy (quenched) groundmass 195.55 -sharp but irregular lower contact		Weak carbonate veining	Trace cp within microfractures, <1-1% diss. py	
195.55 TO 216.40	QFP DYKE «QFPD»	Colour: light to medium green Same as previous QFP dykes ┤208.9-210.35├ «DAC FL BX»				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		┤212.4-214.8├ «DAC FL BX» Screens of dacite flow breccia 208.9-210.35 -<1-2 cm fragments with a light creamy green silica matrix 212.4-214.8 -flow breccia with reddish discoloration to matrix		-weak silica flooding	-2-3% diss. py -2-3% diss. py, locally 7-10% py over 5 cm	
216.40 TO 220.80	DACITE FLOW BRECCIA «DAC FL BX»	Colour: medium green Grain Size: f.gr. Weak breccia texture pervasive reddish siliceous matrix; gradational lower contact			-<1-1% diss py	
220.80 TO 226.80	DACITE LAP TUFF «DAC LT» E.O.H.	Colour: reddish light green Grain Size: c.gr. 1-4 cm and occasional to 8 cm subrounded to subangular cream, marroon and green felsic flow fragments, possible pumice fragments, fragment supported, massive			Trace diss. py, rare fragments with 5-10% diss. py

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 12.20	Casing					
12.20 TO 20.00	DACITE DYKE «FD»	Colour: light green Grain Size: f.gr. Pervasive shattered and milled texture, fine white veinlet stockwork very rubbly core, recovery?			2-3% py mainly as mm veinlets which often act as breakage surfaces, some with smeared pyrite slickensides	
20.00 TO 22.85	ANDESITE LAP TUFF «AND LT»	Colour: dark green Grain Size: f.gr. Extremely rubbly core, occasional <2 cm frothy creamy green rounded fragments		«wk ep» 3-5% diss, 1-3 mm epidote clots, possibly after feldspars, and as epidote amygdules within some frags	trace cp, py	
22.85 TO 28.50	DACITE FP DYKE «FPD»	Colour: tight green Grain Size: f.gr. Similar to previous dyke, pervasive milled texture patchy 3-5% epidote and hematite altered fsp crystals, very rubbly core		Weak epidote and hematite alteration of fsp	24.0-24.5 -minor dark grey muddy, smeared pyrite	
28.50 TO 31.20	ANDESITE DYKE «AND DYKE»	Colour: dark green Grain Size: f.gr. 4-5% epidote altered fsp crystals, minor white calcite veinlets, hematite fracture coatings massive		epidote altered fsp crystals		
31.20 TO 36.80	DACITE FP DYKE «FD»	Colour: light green Grain Size: f.gr. Same as previous dacite dykes; still retains pervasive milled texture with fine white veining stockwork		Patchy epidote alteration of mafic crystals	Patchy 1-2% diss. py	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
36.80 TO 44.80	ANDESITE FLOW «AND FL»	Colour: dark green Grain Size: f.gr. Amygdaloidal with mainly rounded epidote amygdules minor amygdules with chalcopyrite, quartz and chlorite 42.2-43.9 -lighter green more dacitic appearance, possible flow breccia		«mod ep» moderate epidote as epidote filled amygdules, diss. epidote grains, and irregular epidote veining	«1% cp» <1% chalcopyrite mainly within amygdules, minor 1-3 mm clots; patchy 3-4% brassy py diss. aggregate and irregular veining 42.8-43.4 -10-15% coarse brassy py veining	
44.80 TO 63.90	QUARTZ-FSP-HORNBLENDE PORPH DIKE «QFPD»	Colour: light grey green Grain Size: f.gr. 5-7%, 1-3 mm white fsp crystals, 1-3% up to 3 mm epidote altered mafic (hornblende) laths occasional angular quartz eyes, massive but with weak milled texture, weak fine white carbonate veining Upper contact 10 cm strong milled and fragmented texture 59.0-63.9 -gradual color change to dark green andesitic appearance; epidote increases, fsp content decreases lower contact in rubble		epidote alteraton of mafic crystals	trace pyrite	Zoned dyke; FP core, andesitic margin
63.90 TO 149.05	DACITE FLOW /DOME «DAC FL/DOME»	Colour: light to med. green Grain Size: f.gr. Massive, very weak patchy mottled texture, 2-3%, <1-1 mm greenish epidote altered flecks; very weak calcite veining [71.2-74.75] «FHP DYKE» -same as previous dyke with darker green andesitic lower dyke margin [96.3-101.0] «FLT?» -possible fault zone?, brecciated milled texture, numerous anastamosing grey smeared sulphide veinlets		 -patchy weak epidote	<1% py 96.3-101.0 -5-7% py diss and smeared veinlets	Much finer grained and more siliceous then previous dyke

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
					103.7-105.35 -brecciated, 5% coarse brassy py veining, patchy associated bleaching	
		Below 122 m -patchy, strong brecciated appearance increased, white carbonate veining		╢127.6-149.05╟ «WK ANH» -very minor 1-2 mm wide anhydrite veinlets		
		Faint but sharp lower contact @	35			
149.05 TO 163.90	FELDSPAR PORPH DYKE «FPD»	Colour: light green Grain Size: f.gr. 5-7%, 1-3 mm white fsp crystals and crystal aggregates, 1-3%, <1-1 mm dark green mafic flecks in an aphanitic groundmass, strongly brecciated with a fine white carbonate? stockwork 158.4-160.4 -Andesite dyke, dark green, 5-7%, 1-3 mm epidote clots, minor epidote veining 163.9 -lower contact in rubble, possible faulted - clay slips along broken core surfaces		trace anhydrite veinlets	trace pyrite	
163.90 TO 169.90	RHYOLITE «RHY»	Colour: beige green Grain Size: f.gr. Faint, <1-1 mm ghosted grains, moderate brecciated appearance with fine white partially calcite stockwork Strong silicified appearance 169.2-169.9 -spotted hornfels?, appearance or possible spherulies? <5 mm		strongly silicified trace anhydrite veining	<1% diss py	Large xenolith within surrounding FP Dyke?
		sharp lower contact @	40			

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
169.90 TO 178.10	FSP PORPH DYKE «FPD»	Colour: light green Grain Size: f.gr. Same as previous FP dyke; up to 10% fsp crystals, rare quartz eyes Sharp lower contact @	62			
178.10 TO 210.20	DACITE FLOW «DAC FLOW»	Colour: medium green Grain Size: f.gr. Same as previous dacite flow from 63.9-149.05 -patchy flow breccia texture over 50 cm widths 198.8-199.7 -FP Dyke 203.0-205.0 209.0-210.2 -weak bleaching, weak flow breccia texture 205.0-209.0 -Andesite dyke -up to 10%, 2-4 mm epidote clots with a 1.1 m more clastic FP core sharp lower contact @	20	«ANH» -fairly abundant anhydrite veins from 1-8 mm wide; minor calcite veinlets, minor calcite within anhydrite veins	-patchy coarse brassy py aggregate and occasional brassy py veinlets	
210.20 TO 211.80	FELDSPAR PORPH DYKE «FP DYKE» E.O.H.	Colour: med. grey green Grain Size: f.gr. 10%, 1-2 mm fsp, 1-3%, <1 mm green mafic flecks, massive, 20 cm brecciated and veined upper contact

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 18.90	Casing					
18.90 TO 21.30	QUARTZ FSP PORPH DYKE «QFPD»	Colour: medium green Grain Size: f. to m.gr. 7-10%, 1-3 mm euhedral white fsp, <1-3% quartz eyes; massive lower contact possibly	43			
21.30 TO 38.90	DACITE FLOW «DAC FL»	Colour: light green Grain Size: f.gr. 5% <1-2 mm faint whitish euhedral fsp crystals, 1-3% <1 mm tan flecks (leucoxene?) massive, local flow breccia texture 32.9-34.2 -FP Dyke 34.2-36.0 -broken core, weak shattered appearance, faulted at 36.0 m @	15	Patchy moderate bleaching	Trace diss cp, <1% diss py, occasional py slips	Feldspars much fainter than previous dyke
38.90 TO 45.40	ANDESITE LAP TUFF «AND LT»	Colour: medium to dark green Grain Size: f. to c.gr. 15-20%, <1-3 cm white frothy subangular felsic fragments and less distinct andesite frags, occasionally chlorite amygdaloidal Lower contact in rubble		«m ep» moderate epidote altering felsic frags and occurring as abundant 2-5 mm and up to 1 cm disseminated clots	Trace cp and <1% py within felsic fragments 39.35 -large cp clots associated with large epidote patches; occasional coarse brassy py clots	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
45.40 TO 57.40	DACITE FLOW «DAC FL»	Colour: light green Grain Size: f.gr. 3-5%, <1-1 mm faint white fsp crystals in an aphanitic groundmass, massive, increasing shattered appearance towards lower contact Faulted lower contact			<1-2% diss py, patchy 3-5 cm zones of up to 10% diss. py, trace cp	
57.40 TO 62.25	FELDSPAR PORPHYRY DYKE «FPD»	Colour: light green Grain Size: f. - m.gr. 10%, 1-3 mm white fsp crystals, overall <1% qtz eyes, locally 1-2%; rare dark green mafic xenoliths 15 cm milled gougy upper contact darker green, more andesitic looking lower dyke margin, lower contact in rubble		Patchy weak epidote alteration of fsp	Trace pyrite	
62.25 TO 206.65	DACITE FLOW /DOME «DAC FL/DOME»	Colour: light green Grain Size: f.gr. Continuation of previous flow; fairly pervasive mottled flow breccia texture with patchy massive sections; fsp locally absent 62.25-66.1 -brecciated overprinted with fine grey silica stockwork 70.9-75.9 -Fault zone; crushed milled zone with anastamosing fault gouge 71.4-71.55 «FLT @ 30» -15 cm fault gouge with sharp contact @ 30 91.4-118 -strong shattered appearance with gougy milled fault zones as follows: 95.0-96.0 «FLT» -gougy milled zone, sharp upper contact @ 30		Local weak epidote alteration of fsp trace anhydrite - calcite veining	62.25-66.1 -5-7% fine diss. pyrites, patchy coarse brassy py clots and narrow veinlets, trace sp with coarse brassy py Overall <1% diss. py; occasional <5 cm patches of fine pyrite, occasional coarse py aggregates and veinlets	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		⟨100.2-102.0⟩ «FLT» -gougy milled zone, sharp slip surface at: 101.8 m @ 102.0 m @	 25 25			
		112.2-117.7 -possible more andesitic composition or alteration of dacite flow - green epidote alteration of fsp crystals				
		⟨144.9-151.95⟩ «AND DYKE» -andesite dyke; dark green, 5% green epidote altered fsp, massive, <10 cm faint marroon coloure margins		-epidote alteration of feldspars, <1%, 1-4 cm epidote patches		
					152.4-153.4 -moderately bleached interval with patchy 5-7% fine diss. py	
		153.4-160.6 -well developed mottled flow breccia texture				
		160.6-160.9 -screen of dacite lapilli tuff; well packed angular 5 mm - 1 cm dacite flow fragments			-2-3% diss. py	
		172.4-182.5 -good mottled flow breccia texture				
				⟨187.5-191.4⟩ «Anh» -trace anhydrite veining		
		⟨192.8-192.9⟩ «FLT @ 25» -10 cm fault gouge zone, sharp lower contact @	 25			
		198.8-206.65 -medium grey green coloration, fsp absent, first 1.8 m strong fragmental (flow breccia) texture with possible sphalerites; remainder of unit aphyric and massive, moderate brecciated overprint with fine white carbonate stockwork

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 22.90	Casing					
22.90 TO 105.10	FELSIC DYKE «FD»	Colour: light brown, patchy, med. grey Grain Size: f.gr. Locally <1-1 mm, <1-3% euhedral calcite altered feldspars, patchy <1-2 mm pitted amygdules/ vesicles, which occasionally are calcareous, <1 to locally 2-3%, < 1 mm chlorite flecks and laths (amphiboles) Massive, very fine grained groundmass ╟63.8-66.1╢ «FLT» @ 40 deg -fault zone, shattered and milled, patchy pale green siliceous stockwork, weak calcite veining 64.1 -fault gouge @	40	Calcite alteration of feldspars; soft pink mineral (zeolite) along breakage surfaces		Massive - no flow textures
		66.1-105.1 -2-5% sericite - calcite altered feldspars and 2-5% green chlorite-calcite altered 1-3 mm mafic clots (amphiboles) Sharp lower contact, slightly irregular @	25	-calcite - sericite alteration of fsp, chlorite-calcite altered mafics		
105.10 TO 127.45	DACITE FLOW «DAC FL»	Colour: light green Grain Size: v.f.gr. Massive, aphyric, weak, very fine white veining stockwork 10-15 cm wide fault gouge zones as follows: 115.4 125.9 127.0 111.5-113.1 -mafic dyke, dark green fine grained, massive, fine calcite amygdules, 60 cm fault gouge at upper contact, indistinct lower contact 113.1-116.8		Trace anhydrite	Trace py	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		-felsic dyke, same as previous unit but lacking abundance of altered fsp and mafics, trace anhydrite veinlets				
127.45 TO 160.35	FELDSPAR PORPHYRY DYKE «FP DYKE»	Colour: light green Grain Size: f. to m.gr. 7-15%, 1-3 mm euhedral fsp and fsp clusters, 1-3% dark green mafic clots with leucoxene? flecks, few which look like hornblende laths, occasional > 1 cm mafic xenoliths, rare quartz eyes, massive, fine white carbonate veining [142.4-149.15] «AND DYKE» -Andesite dyke -medium to dark green, 3-75, 1-3 mm epidote altered crystals (mafics?), faint white feldspars, massive, sharp upper contact @ 60 156.65-160.35 -dyke margin, slightly darker colour, epidote alteration of feldspars and xenoliths		Patchy weak epidote alteration of fsp		
160.35 TO 162.50	DACITE FLOW BRECCIA «DAC FLBX»	Colour: pale green Grain Size: f.gr. Block and lapilli size fragments of bleached pale green dacite flow with ghosted feldspars, tightly packed Numerous 1-3 cm gougy zones and interfragmental gouge; shearing and fault increase below 161.9 m last 25 cm strongest shearing, convoluted layering C-S fabric, shearing @ 55		Strong bleached altered appearance	Local interfragmental pyrite Smeared sulphides producing laminated green black layering	
162.50 TO 163.85	MASSIVE & FRAGMENTAL SULPHIDES «MS»	Colour: dark grey Grain Size: f.gr. 162.5-162.88 -massive sulphides with approx. 15% felsic frags; sulphides cut by fine anhydrite veining Possible bedding at top of unit @ 60-65 deg			-20% sp, 15-20% py, 1-2% cp, patchy 1-2% galena	-weakly conductive

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		162.88-163.85 -sulphides becoming sheared, brecciated into fragments and mixed wiht a chloritic gougy matrix 163.45-163.8 -orange fwhite irregular broken veining, possible barite? Sharp lower contact @	53			
163.85 TO 173.20	FELDSPAR PORPHYRY DYKE «FPD»	Colour: light green Grain Size: f.gr. 5-10%, 1-2 mm white fsp crystals, <1-2% green mm chlorite flecks and larger xenoliths Massive but becoming shattered with fault gouge zones below 170.0 m 170 m -10 cm fault gouge @ 171.3-171.5 -green fault gouge with <5 mm pyrite and sphalerite fragments 172.6 -smeared sphalerite slip surfaces, minor gouge @ Minor gouge and smeared sulphides along lower contact	20 30 33	Minor anhydrite veining	Rare mm wide py veinlets	
173.20 TO 220.80	ALTERED & MINERALIZED DACITE FLOW /DOME «DAC FL»	Colour: med. grey to light green at end of unit Grain Size: fine grained Massive, patchy autobrecciation and flow banding brecciated with fine sulphide stockwork and sulphide flooding 174.55-175.8 -FP dyke, fresh trace py and cp, sharp upper contact @ sharp lower contact @	30 60	173.2-190.0 -feldspars altered to soft light green sericite -below FP dyke fsp patchy	⫞173.2-189.1⫟ «Sph/cp Stkwk» <1-2% diss black and straw coloured sphalerite, <1-1% diss. cp, 10-20	Stockwork and sulphide good conductors

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
				below 190 patchy fresher sharper outlined feldspars	diss and stringer py 177.8-182.3 -well developed fine py-sp-cp stockwork 10-20% diss and stringer py, 2-3% sp, <1-1% cp 183.65-189.1 -weaker py-cp-sp stockwork with 8 cm semi-massive zone at 188.8 m 189.1-211.6 «Py Stkwk»	
				202.0-220.8 -occasional carbonate-anhydrite veining	-10-25% fine py as 1-4 mm wide stringers, trace straw coloured sphalerite, and very fine diss py flooding throughout	
				215.0-220.8 -bleached, light green colour, fsp ghosted		
		220.4-220.8 -bleached dacite flow frags and hyaloclastite with sheared appearance Sharp lower contact @	55		220.4-2520.8 -<1% diss. sp, trace gn	
220.80 TO 234.20	FELDSPAR PORPHYRY DYKE «FPD»	Colour: med. green Grain Size: f. to m.gr. 10%, 1-3 mm white fresh feldspar phenocrysts, 1% 1-3 mm mafic grains and occasional 1-2 cm mafic xenoliths, massive Lower contact @	30	Anhydrite veining common		
234.20 TO 235.20	DACITE FLOW «DAC FL»	Colour: light green Grain Size: f.gr. Massive, 5-7% faint ghosted light green altered fsp crystals in an aphanitic groundmass 234.85-235.05		Serite? altered fsp -trace anhydrite veining	234.8-235.05	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		-lapilli tuff, weakly bleached, dacite flow frags and <1%, 3-4 mm py-sp fragments			-<1%, 3-4 mm py-sp fragments	
235.20 TO 235.70	MASSIVE SULPHIDES «MS»	Colour: black, green, grey Grain Size: f.gr. 15 cm of massive py-sp-cp mixed with strongly altered dacite flow fragments 235.35-235.7 -gougy fragmental to stringery textured pyrite and sphalerite, approx 1-2% Zn -fault gouge at upper and lower contacts upper @ lower @	 70 50		-first 15 cm, 2% Cu, 5% Zn	Lower horizon! Good conductor over 15 cm width
235.70 TO 240.50	DACITE FLOW BRECCIA «DAC FLBX»	Colour: mottled light green Grain Size: f.gr. Very faint possible feldspars, mottle flow breccia texture 236.55 -5 cm fault gouge @ 240.5 -sharp lower contact @	 60 55	Weak anhydrite veining, fairly fresh appearance	235.7-236.6 -5-7% fine brassy pyrite diss and fine stockwork	
240.50 TO 246.30	FELDSPAR PORPHYRY DYKE «FPD»	Colour: medium green Grain Size: f. to m.gr. 5-10%, 1-3 mm white feldspars, 2-4% green, <1 mm mafic flecks and locally 2-3%, 5 mm - 1 cm mafic xenoliths -massive		Below 244 - 1-2% diss epidote		Dummy probe stuck in hole at 55 m

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 34.10	Casing					
34.10 TO 69.00	FELDSPAR HORNBLENDE PORPHYRY DYKE «FHPD»	Colour: medium green Grain Size: f. to m.gr. 10%, 1-3 mm euhedral feldspar phenocrysts, 5-7% <1-1 mm irregular and fine lath shaped green mafic flecks, laths = hornblende; occasional 0.5-2 cm mafic xenoliths; rare 1-2 mm round quartz eyes 65.5-65.9 -Fault zone, grey fault gouge, sulphides smeared and diss. within gouge 68.9 -6 cm grey pyritic fault gouge, shearing @	 30	60.5-69.0 -strongly bleached	-patchy, brassy pyrite disseminated and veinlets	
69.00 TO 72.20	ANDESITE FLOW «AND FLOW»	Colour: dark green Grain Size: f.gr. Massive, aphyric, <1% to locally 3%, 1-2 mm chlorite +/- silica amygdules				Trace cp within veinlets and amygdules 71.4-72.2 -up to f5-7% fine diss. pyrite
72.20 TO 268.40	DACITE FLOW /DOME «DAC FLOW/DOME»	Colour: light green, patchy, mottled green Grain Size: f.gr. Massive to patchy mottled flow breccia, patchy secondary brecciation wiht white siliceous stockwork; patchy dark green, sericite/chlorite stockwork especially within flow breccia zones Patchy, pitted feldspar phyric up to 7%, 1-2 mm weakly calcareous feldspars; patchy 2-3% green mafic flecks; 2-3% white, <1 mm flecks = leucoxene?		Fairly fresh, patchy silica stockwork	┤72.2-99.2├ «tr sp-cp» -trace diss sphalerite and chalcopyrite rare py-cp and py-cp-sp veins, some veining over 15 cm width -some veining mineralization coarse grained open void fillings 93.15 -15 cm stringery py-cp-sp ┤135.7-139.2├ «Sph stgr»	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
					-<1% diss sp, two 1-2 mm wide py-sp stringers, very shallow to c.a.	
		161.1-186.0 -irregular red hematitic patches				
		198.5 m -Fault @	40			
				⟨209.3-268.4⟩ «Anh vns» -1-3 mm wide anhydritic veins, some irregular patches to 5 cm		
		255.3-258.0 -Dacite dyke; medium green, same appearance as usual FP dyke but lacking fsp; abundant mafic flecks and xenoliths				
		-sharp upper contact @	25			
		-sharp lower contact @	20			
268.40 TO 292.00	FELDSPAR HORNBLENDE PORPHYRY DYKE «FHPD»	Colour: medium green Grain Size: f. to m.gr. 10-12%, 1-3 mm euhedral feldspar phenocrysts -5% mm dark green flecks some with euhedral lath shapes, <1-2 cm mafic xenoliths common		«Anh vns» -fine anhydrite veining common	278.3-286.3 -1-3% diss. pyrite	
		284.65-285.7 -screen of dacite flow with abundant anhydrite veining				
		292.0 -sharp lower contact @	40			
292.00 TO 308.20	QUARTZ FSP PORPHYRY DYKE «QFPD»	Colour: med. green Grain Size: f. to m.gr. 10%, 1-3 mm euhedral fsp, 3-5%, 1-3 mm subrounded quartz eyes, occasional mafic xenoliths, decreased mafic flecks from previous unit -massive -fragmental upper contact possible fault breccia?		«Anh vns» -weak anhydrite veining	-trace pyrite	
		-sharp lower sheared contact @	45			

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
308.20 TO 324.30	DACITE FLOW/DOME «DAC FL»	Colour: olive green Grain Size: f.gr. 3-5%, 1-2 mm, chalky white, very soft altered feldspars phenocrysts -1-1% <1 mm green mafic flecks in an aphanitic groundmass massive -sharp but irregular lower contact		«Anh» -weak anhydrite veining; sericite or possible anhydrite?? alteration of fsp	-tr py	
324.30 TO 385.60	FELDSPAR HORNBLENDE PORPHYRY DYKE «FHPD»	Colour: medium green Grain size: f. to m.gr. 10-15%, 1-2 mm euhedral feldspar crystals, 3-5% mm mafic flecks, some with good rectangular out-lines locally quartz phyric, quartz eyes more common below 343 m		«Anh» -weak anhydrite veining, locally quite strong over 1 mm widths	-trace py, cp

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 37.20	Casing					
37.20 TO 44.30	DACITE LAP TUFF «DAC LT»	Colour: med. green Grain Size: f. - m.gr. Predominantly feldspar phyric dacite flow frags and minor andesite fragments in a fsp phyric matrix		Patchy epidote attacking occasional bleached felsic fragments	Trace py	
44.30 TO 69.00	DACITE FLOW BRECCIA «DAC FL BX»	Colour: mottled light to med. green Grain Size: f. - m.gr. 3-5%, 1-2 mm white fresh sharp feldspars, <1-1% dark green <1 mm mafic flecks, mottled flow breccia texture becoming more massive below 57.5 m 64.9-69.0 -more massive, patchy epidote altered fsp, possible dyke 69.0: faulted lower cotnact @	20	Fresh		
69.00 TO 86.70	FELSIC DYKE «FEL DIKE»	Colour: reddish brown Grain Size: f.gr. 5%, 1-2 mm orangish and greenish white, weakly calcite altered feldspar crystals, <1% faint green mafic flecks in an aphanitic groundmass -<10 cm wide amygdaloidal dyke margins		Very weak calcite alteration of fsp		Same rock as top of hole 91-10
86.70 TO 96.25	DACITE FSP PORPHYRY FLOW/DYKE? «FPD?»	Colour: light green Grain Size: f. - m.gr. 7-10%, 1-2 mm greenish white fsp, massive with fairly strong brecciated texture with greenish white stockwork below 92 m 96.0-96.25 -sheared pyritic gouge at lower contact -sharp lower contact @	30		-pyritic fault gouge, trace sphalerite	Unit lacks mafic flecks and xenoliths diagnostics of FP Dyke

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
96.25 TO 106.35	ANDESITE DYKE «AND DIKE»	Colour: dark green Grain Size: f.gr. 5-7% disseminated epidote, some as altered fsp crystals, massive cut by fine white carbonate veining. epidote poor zones more dacitic appearance		Disseminated epidote, 1-5 cm epidote 1-5 cm epidote patches and irregular epidote veining -trace anhydrite	Trace diss. cp, py	
106.35 TO 158.75	FELDSPAR HORNBLENDE PORPHYRY DYKE «FHPD»	Colour: light to med. green Grain Size: f. to m.gr. Massive, 7-10%, 1-2 mm feldspars, up to 5%, 1 mm irregular dark green mafic flecks, some with good lath outlines, occasional cm scale dark green mafic xenoliths 108.3-109.15 -screen of dacite flow		«Anh» Weak anhydrite veining		
158.75 TO 160.40	DACITE FLOW «DAC FL»	Colour: light green Grain Size: f.gr. Massive, 3-5% <1 mm white flecks, leucoxene?, 40 cm brecciated anhydrite veined lower contact; faulted lower contact		Weak anhydrite		
160.40 TO 161.90	ALTERED FROTHY DACITE? FLOW BX «DAC FL BX»	Colour: medium grey Grain size: f.gr. 2-3 mm to 4 cm frothy flow fragments, smaller fragments partially as matrix -7 cm fault gouge at upper contact; lower contact in broken core		Grey bleached appearance	«3-5% py, <1-1% sp, tr cp» -disseminated within and between fragments, minor sulphide veining/ stockwork	
161.90 TO 214.90	FELDSPAR HORNBLENDE POPHYRY DYKE «FHPD»	Colour: medium green Grain Size: f. to m.gr. -7-10%, 1-2 mm euhedral fsp phenocrysts, 2-3%, 1mm mafic flecks some with good rectangular outlines; large mafic xenoliths common, massive Rubbly gougy lower contact		«Anh» -weak anhydrite veining throughout		

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
214.90 TO 242.35	ANDESITE LAPILLI TUFF PILLOWED FLOW «AND FLBX»	Colour: med. to dark green Grain Size; f. to m.gr. Unit characterized by large irregular frothy frags some which could be injection pillows, with abundant < 1 mm round amygdules and 1-2 mm green soft altered feldspars; matrix fine - coarse grained ash and flow detritus, possible feldspars and sphalerites; locally hyaloclastite 234.2-235.2 -Fault zone, gougy brecciated core, upper fault @	20	Sericite altered fsp, moderate pervasive sericite, soft core	-<1% diss py rare, coarse brassy aggregate and veinlets [218.95-219.05] «MS/.1M» -15-20% mm diss grains of dark and straw coloured sph, 5% f. diss py, 2% diss cp in dark soft matrix 232.1 -4 cm diss cp-sp, same form as previous exhalite 232.3-232.4 -very fine grained pyrite flooding 242.0-242.35 -3-5% diss and veined pyrite	Horizon?
242.35 TO 346.25	FELDSPAR HORNBLENDE PORPHYRY DYKE «FHPD»	Colour: med. green Grain Size: f. - m.gr. Massive, as for previous FHP dykes; locally qtz phyric 281.95-283.9 -screen of andesite flow, dark breccia, fine grained, massive, <1-1 mm chlorite amygdules, 2-3% fine diss brassy pyrite, minor py veining 303.0-346.25 -<1-1% quartz eyes		«Anh» Fine anhydrite veining common, locally veins up to 5-15 cm wide 286.53-286.8 -quartz vein 304.6-305.3 -weak bleaching, brecciated with dark siliceous veining, minor anhydrite veining	Local 1-2 cm quartz veins with coarse brassy pyrite; rare up to 5 mm clots of cp <1% py cubes 255.1-256.7 -traces of diss. cp 262.8-266.7 -1-2% diss py, minor py veinlets -5% brassy py, trace chalcopyrite -10% fine brassy py associated with siliceous veining, 2-3% diss. pyrite, trace of cp clots	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
				307.0-308.0 -weak bleached vein selvage	-1 cm wide quartz py vein running parallel to core axis	
				309.85-313.2 -patchy moderate bleaching		
				313.2-315.5 -pervasive strong bleaching, silica flooding and quartz veining	-7-10% coarse brassy pyrite, traces cp, sulphide associated with quartz veining	
		315.5-316.4 320.15-320.25 321.85-322.2 -screen of amygdaloidal andesite			314.2-314.35 -2% diss. cp	
		340.2-341.75 -screen of light green fine grained dacite flow breccia

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 24.40	Casing					Bedrock at 60 ft., cased to 80 ft.
24.40 TO 41.80	ANDESITE LAPILLI TUFF «AND LT»	Colour: medium to dark green Grain Size: f. to c.gr. 5 mm - 1 cm occasionally up to 5 cm subangular subrounded fragments of green dacite-andesite occasionally frothy and bleached, white, felsic fragments in a granular coarse ash matrix, massive, very rubbly core 35.7-41.8 -Fault zone -very rubbly core, very poor recovery <10%		«wk ep» -weak epidote as disseminated grains within matrix and as almost 100% alteration of larger fragments		
41.80 TO 44.80	FAULT ZONE «FLT»	Colour: medium green Grain Size: f.gr. Green clay fault gouge with 1-3 mm green dacite granules, 10% recovery				
44.80 TO 66.10	DACITE FLOW «DAC FL»	Colour: light to medium green Grain Size: f.gr. 3-5% greenish white 2-3 mm feldspar phenocrysts, 2-3% <<1 mm white specks, patchy flow breccia texture -very rubbly core, poor recovery 47.9-50.9 52.7-55.8 -no core recovered -lower contact in rubble				
66.10 TO 74.95	ANDESITE LAPILLI TUFF «AND LT»	Colour: dark green Grain Size: f.gr. Indistinct <5 mm to 1 cm andesitic fragments, occasionally frothy fragmen outlines defined by disseminated epidote grains along rims -rare white felsic fragments, tightly packed		Weak, disseminated epidote within matrix	Trace py	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
74.95 TO 95.50	DACITE ASH ULTRAFINES «DAC ASH»	Colour: light green Grain Size: aphanitic to fine grained Massive, dacite ash locally bedded but usually bedding planes are distorted - slumped, eroded, flame structures, occasionally darker grey intervals with very fine sulphides 74.95-76.8 -3-5 cm wide zones of feldspar phyric - possible pumice frags 91.85-93.1 -pyritic ash			Occasionally thin beds of pyritic ash, very fine grained diss. py -up to 30 cm wide intervals of 7-10% very fine diss. py; 92.95: 2 cm wide sulphide mud	
95.50 TO 99.50	DACITE LAP TUFF «DAC LT»	Colour: med. green Grain Size: f. to c.gr. <1-2 cm dark green fsp phyric pumice fragments and occasional dacite ash fragments in a coarse grained angular flwo detritus matrix; minor ash and crystal tuff matrix at top of unit			Very fine grained pyrite within dacite ash	Similar in appearance to Seneca pit HW marker but more dacitic GMS
99.50 TO 108.50	DACITE ASH «DAC ASH»	Colour: med. green, dark grey Grain Size: f.gr. Massive to poorly laminated ash, bedding defined by pyritic ash and occasional chert laminations, bedding often distorted, bedding varies from 45-60 deg		Very fine anhydrite veining	Occasional beds and laminations of dark grey ash with very fine dissem. pyrite	
108.50 TO 110.70	ANDESITE LAPILLI TUFF «AND LT»	Colour: medium green Grain Size: f. to c.gr. 4-6 cm dacite FP flow fragments in a green andesitic matrix; occasional <1 cm distinct andesite fragments		Occasional anhydrite veins up to 2 cm wide	2-3% fine diss py, locally 5-7% py over 10 cm	
110.70 TO 115.50	ANDESITE DYKE «MD»	Colour: dark green Grain Size: f.gr. Massive, amygdaloidal with irregular 1-2 mm chlorite - epidote amygdules, 2-3% epidote some as <1 cm patches and as 1-2 mm grains - possible		Epidote alteration as occasional veins, diss grains and small balls and patches weak fine anhydrite veining	trace py	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		altered feldspar crystals				
115.50 TO 117.90	ANDESITIC AND DACITE LAP TUFF «DAC LT»	Colour: dark green light green Grain Size: f. to c.gr. 115.5-116.4 -similar to unit from 108.5-110.7 116.4-117.9 -dacite lapilli tuff, light green dacite ash fragments in a fsp phyric crystal tuff matrix		-weak anhydrite veining	116.4 -2-3% diss py within fragments	
117.90 TO 119.95	PYRITIC DACITE ASH «DAC ASH»	Colour: light green, dark green Grain Size: f.gr. Distorted and fragmented interbedded light green dacite ash and dark grey pyritic ash Bedding @ may not be reliable	50	Fine irregular anhydrite veining occasional wide irregular veins	«Tr py» Very fine diss. pyrite with ashes, weak fine pyrite stockwork	
119.95 TO 122.00	DACITE FSP CRYSTAL TUFF «DAC XT»	Colour: light grey green Grain Size: c.gr. Massive, coarse granular texture, abundant 1-2 mm fresh feldspar crystals, weakly fragmental towards base		Anhydrite veining	121.1-121.2 -7-10% coarse brassy pyrite associated with anhydrite veining	
122.00 TO 134.40	DACITE ASH «DAC ASH»	Colour: olive green Grain Size: aphanitic to f.gr. Massive, silicified or cherty ash, brecciated with a dark very fine sulphide stockwork; locally coarse grained ash and fragmented fine ash in coarse ash matrix		«m. to str. ANH» -abundant very fine anhydrite veinlets; silicified	«py stockwork» -very fine dark pyrite stockwork	
134.40 TO 140.10	DACITE FSP PORPHYRY FLOW «DAC FL»	Colour: med. grey Grey Size: f.gr. 3-5%, 1-2 mm feldspars in a fine grained ground mass 134.4-135.8 -flow breccia; fragments of dacite ash and blocks		weak fine anhydrite veining	patchy faint fine sulphide stockwork patchy 2-3% diss py	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		of flow in a fsp crystal tuff matrix				
140.10 TO 143.75	DACITE ASH «DAC ASH»	Colour: med. grey green Grain Size: f. to m.gr. Massive to very poorly bedded ash, patchy silicified or cherty ash, occasional fine sulphide rich ash laminations bedding @ 40-50 deg		«w - m anh» weak to moderate fine anhydrite veining	occasional fine sulphide laminations	
143.75 TO 152.20	FELDSPAR PORPHYRY DYKE «FPD»	Colour: med. green Grain Size: f. to c.gr. 7-10%, 1-3 mm feldspars, rare mafic xenoliths and 1-2% mafic flecks, massive 145.15-146.0 -dacite crystal tuff, coarse grained, granular, ash, 5-75 feldspar, massive 152.2 -sharp but irregular lower contact		very weak anhydrite veining	trace diss. py -5-7% fine diss pyrite, trace sph	
152.20 TO 154.50	DACITE ASH «DAC ASH»	Colour: light green, light grey Grain Size: aphanitic to coarse ash 152.2-153.4 -ultrafine ash, light green, massive 153.4-154.5 -coarse granular ash, light grey, massive -contact between the two ashes @	68	-weak to moderate anhydrite veining	153.8 «MS Frag» -weak fine py veining/stockwork 153.4-154.5 -2-3% fine diss. py, locally <1-1% very fine tan sp -1-2 cm massive sulphide fragments at 153.8 and 154.45	
154.50 TO 155.60	MASSIVE SULPHIDES «MS»	Colour: brassy, grey Grain Size: f.gr. Sheared, brecciated, distorted clay gouge, barite, massive pyrite and sphalerite bedding possibly @ Rare pyrite very siliceous fragments	65		40% massive fine pyrite 5-6% sphalerite as <1 cm - 5 cm wide semi-massive zones; traces of chalcopyrite	2.5-3% Zn

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
155.60 TO 184.65	DACITE FLOW «DAC FL»	Colour: light green, medium to dark grey Grain Size: f.gr. Brecciated or flow breccia, patchy white silica stockwork, well developed sulphide stockwork 155.6-155.9 -fine granular ash tuff -individual flow fragments are subangular to angular, monolithic, contain vague amygdules (?) 159.8-162.15 -feldspar porphyry dyke 5% faint feldspar phenocrysts, 1-2% mafic flecks 162.15-164.5 -patchy frothy andesitic? fragments 162.15-164.5 -patchy, frothy andesitic fragments 166.7 -10 cm fault gouge @ -intensely deformed material wrapping around a 5 cm x 5 cm MS clast	50	«stg-i si» -intense silica as a matrix to Dac Flow fragments -in areas of strong mineralization silica stockwork and pervasive silicification; very weak anhydrite as fine veinlets and <1 cm clots -weak anhydrite veining	┤155.6-159.8├ «Sph-cp-py Stkwk» -well developed py-sp-cp stockwork and disseminations trace galena 155.6-159.8 -3-4% sp, 0.5% cp, 5-7% py stringers stockwork and disseminations -last 10 cm weak fine py veining ┤162.15-185.25├ «Sph-cp-py-stkwk» 162.15-164.85 -<1-2% diss. py, trace diss sp 164.85-166.6 -2% sp, 5-7% py ┤166.7├ «MS frags» 166.6-168.05 -7-10% py, 2% sp, 1-2 cp stockwork and diss includes 6 cm massive py-sp zone at top ┤168.05-168.45├ «MS» -massive sphalerite, 3% cp, 7-10% py 168.45-173.95 -8-10% sp, 1% cp, <1% gn, well developed stockwork 173.95-184.65 -strongly brecciated, weak pyrite stockwork with minor sp, cp and gn 176.15-176.66	Style of silicification and sharp angular nature of fragments combined with open space filling reminiscent of epigenetic systems 166.6-173.95 -best developed sphalerite-chalcopyrite stringers and stockwork mineralization -2-5 cm massive sulphide veinlets wander throughas matrix of dacite flow fragments -more pyrite and less chalcopyrite lower down in stockwork system

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		Faulted lower contact @	40		177.38-177.95 -sp-cp stringers	
184.65 TO 195.85	DACITE LAP TUFF «DAC LT»	Colour: creamy green white Grain Size: c.gr. < 2cm angular fragments mainly of dacite flow, minor pumice frags, pyritic ash and chert; strong bleaching masking fragment outlines; coarse granules patchy feldspar phyric ash matrix, massive 184.65 -10 cm fault gouge at upper contact 192.8-193.15 -sulphide mud - possibly large fragments, heterolithic, fining upward sequence		«i si» Strongly bleached and silicified, minor transparent anhydrite veining; bleaching decreasing below 194 m 193.15-193.45 -1-2% diss green mica, fuchsite	3-5% fine diss pyrite, <1% patchy diss cp and sp/gn; py rich fragments <1 cm common 185.0-185.25 -5 mm wide cp stringer 192.8-193.15 -sulphide mud, fragments?	Volcaniclastic 184.6-198.75 -essentially a sediment package of LT/ASH/XT
195.85 TO 196.75	DACITE ASH «DAC ASH»	Colour: light to med. green Grain Size: aphanitic to fine grained Massive to poorly laminated ash 196.2-196.3 -pyritic ash, bedding @	70		Dark grey, very fine sulphide stockwork <1% diss cp, <1% sp as fine veinlets and clots within py veins, 3-5% fine py veining	
196.75 TO 198.75	ANDESITE FLOW? «AND FL»	Colour: med. olive green Grain size: f.gr. Massive at top becoming brecciated or fragmental below 198.2 m; 1-2% <1 mm chlorite spots = amygs 198.2 -20 cm frothy chlorite amygdular fragmental zone			┤198.2-198.4├ «2% cp, 3% sp» -2% cp, 3-4% sp, 1-2% py diss, clots and veins all interfragmental	Similar to unit hosting sp exhalite in hole S-91-12
198.75 TO 219.65	FELDSPAR PORPHYRY DYKE «FP DYKE»	Colour: med. green Grain Size: f.gr. 10-12%, 1-2 mm feldspar phenocrysts, 2-4% <1 mm mafic flecks, rare 1-2 cm mafic xenoliths		Fresh, trace anhydrite veining		

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
					201.6-201.75 -brecciated fine quartz stockwork with 5% brassy py	
		Lower contact 10 cm, fragmental appearance				
219.65 TO 225.85	ANDESITE BLOCK AND LAP TUFF «AND BLT»	Colour: dark green Grain Size: f. to c.gr. Angular block and lapilli size red and red-grey dacite fP flow fragment, rounded lapilli sized indistinct amygdaloidal mafic flow fragments in a mafic matrix		«wk chl» weak chlorite alteration within matrix; trace anhydrite veining	 patchy 2-3% and locally 5% diss pyrite	 Dacite fragments look almost identical to FP Dyke
		220.05-223.9 -mafic flow dyke?, massive, chlorite and epidote filled amygdules; no dacite or mafic fragments		-epidote veining, large irregular patches and within amygdules		
		Sharp lower contact with anhydrite veining @	45		py-cp associated with anhydrite veining at lower contact	
225.85 TO 234.10	MAFIC FLOW BRECCIA, PILLOW BX «AND FLBX»	Colour: dark green Grain Size: f. to m.gr. 5-10% rounded to irregular shaped, marroon, calcite and chlorite amygdaloidal ameboid pillows with light green selvages Indistinct green mafic fragments occasionally chlorite amydaloidal in a matrix of 2-5 mm mafic fragments mixed with chlorite -frothy vesicular fragments densely packed		Chlorite alteration of matrix; rare 2 cm wide transparent anhydrite veins		Resembles Seneca Deposit host
		233.3-233.8 -mafic flow breccia mixed with dacite lapilli tuff (possible blocks of dacite) composed of <1 cm dacite flow and rare andesite flow fragments in a coarse ash matrix			-<1% diss. py	
					⌈233.85-233.95⌋ «3% sp» -3% sp, 2-3% py, tr cp as interfragmental disseminations and very fine veinlets	Mineralization at top of massive flow, base of breccia; downdip equivalent of S91-12

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
234.10 TO 242.50	MAFIC FLOW «AND FL»	Colour: dark green Grain Size: f.gr. Fairly massive, patchy 5-7%, 1 mm dark green soft spots, some with euhedral outlines (fsp) 234.1-235.45 -weak fragmental texture 235.45-237.0 -FP Dyke, weak fragmental upper contact, sharp lower contact		Weak anhydrite veining -sericite alteration of feldspars; trace epidote veining	-trace py, cp	
242.50 TO 257.50	FELDSPAR PORPHYRY DYKE «FPD»	Colour: light to med. green Grain Size: f.gr. 10%, 1-2 mm euhedral feldspars, rare mafic xenoliths up to 5 cm 254.0-256 -2nd FP dyke intruding first with banded/layered margins 257.5 -20 cm fragmented lower contact				
257.50 TO 275.80	MAFIC TUFF/ AMEBOID PILLOWED FLOW «AND FL»	Colour: dark green Grain Size: Fine to coarse grained mafic flow detritus, hyalo-clastite, amygdular fragments with occasional frothy amygdular small ameboid injection pillows			┤267.9-272.95├ «tr sp-cp» -traces of sp and cp disseminated and fine interfragmental stringers ┤272.95-275.8├ «sp-cp stringers» -patchy 2-10 cm semi-massive sp+/-py, cp stringers, minor 1-2 mm veinlets and disseminations	
275.80 TO 278.50	MAFIC FLOW «AND FL»	Colour: dark green Grain Size: f.gr. Massive, <1-1 mm round chlorite amygdules, weakly brecciated with fine anhydrite +/- calcite			trace py, cp	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		veinlets Sharp lower contact approx.	 60		277.85-278.15 -strong brecciation, silicification, 5% brassy py, <0.5% cp	
278.50 TO 347.50	FELDSPAR HORNBLENDE PORPHYRY DYKE «FHPD»	Colour: light to med. green Grain Size: f. to m.gr. 5%, 1-2 mm chalky white feldspar, 3-5%, 1-5 mm speckled mafic clots, small rectangular flecks = hornblende, larger clots = xenoliths?; occasional cm scale mafic xenoliths 283.8-286.0 -mafic dyke, massive, epidote chlorite amygdules rubbly core 293.7-297.2 -patchy strong brecciation over 20-50 cm widths with clay gouge and anhydrite matrix, fault zone 339.0 -gougy grey and green slip planes @ E.O.H.	 15	Weak anhydrite veining; occasional cm scale anhydrite veins 305.0-305.65 -massive, translucent, white and orange white anhydrite vein	Trace pyrite	«anh» anhydrite bearing 66 rods dropped to bottom of hole (201.2 meters)

MINNOVA INC.
DRILL HOLE RECORD

IMPERIAL UNITS: METRIC UNITS: X

PROJECT NAME: SENECA
PROJECT NUMBER: 663
CLAIM NUMBER: DOROTHY 4
LOCATION: Fleetwood

PLOTTING COORDS GRID: Ideal
NORTH: 51.00S
EAST: 8548.00E
ELEV: 269.00

ALTERNATE COORDS GRID: Vent
NORTH: 0+10N
EAST: 86+ 0E
ELEV: 269.00

COLLAR DIP: -75° 0' 0"
LENGTH OF THE HOLE: 340.46m
START DEPTH: 0.00m
FINAL DEPTH: 340.46m

COLLAR GRID AZIMUTH: ° ' "

COLLAR ASTRONOMIC AZIMUTH: 50° 0' 0"

DATE STARTED: July 16, 1991
DATE COMPLETED: July 22, 1991
DATE LOGGED: 0, 0

COLLAR SURVEY: NO
MULTISHOT SURVEY: NO
RQD LOG: NO

PULSE EM SURVEY: YES
PLUGGED: NO
HOLE SIZE: NQ

CONTRACTOR: F. Boisvenu Drilling
CASING: 6.1
CORE STORAGE: On property

PURPOSE: Test S91-16 massive sulphides and footwall strger zone 200 m grid west.

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 6.10	CASING					
6.10 TO 29.10	FELDSPAR PORPHYRY DYKE «FPD»	Colour: light green Grain Size: f. and m.gr. Feldspar phenocrysts (1-3 mm) randomly distributed in ultrafine grained matrix -massive, fresh -faint 1-2 mm chlorite flecks possibly replacing hornblendes -occasional 5 cm xenoliths -upper 6 meters fine grained and fsp, more faint Lower contact sharp at	25	-nil	-tr py near lower ctc	Siliceous mottling, carbonate veining and ground core near lower cts - fault? approx. 29.0
29.10 TO 57.00	ANDESITE BLOCK AND LAPILLI TUFF «AND BLT»	Colour: Grain Size: -distinctive large blocks of felsic material and large scoria bombs (35.66) wiht epidote attacking mafic component of fragments -in general matrix supported -some felsic lapilli flow banded -heterolithic and poorly sorted -some large up to 3 mm chlorite filled amygdules ┤39.5-44.1├ «DAC LT/ASH» -LT/Ash, lapilli and ash tuff, massive well sorted contains jasper horizon at 42.0 m ┤48.2-52.7├ «ASH» -fine grain, massive, almost a mud at base		-moderate to strong epidote attacking framework -chlorite filling amygdules and vesicles of scoria bombs ┤48.2-52.7├ «mod chlor» -chlorite moderate	-trace amounts of chalcopyrite and sphalerite ┤42.0├ «Jasp, py» -bedded hematitic chert and pyrite over 3 cm, 1-3 mm m.gr. py laminae ┤45.2-57.0├ «tr cp» -trace to 1% chalcopyrite as disseminated clots	36410 -29.61-32.61 36411 49.7-52.7 53.95-57.0 -2.65 core loss
57.00 TO 93.30	FELDSPAR PORPHYRY DIKE «FPD»	Colour: light green to grey Grain Size: -massive, fresh feldspar porphyritic -chlorite flecks -occasional 3-5 cm mafic inclusions -lower ctc in rubble		-nil	-nil -traces cp at 62.1 (very unusual)	As previously described 36412 75.3-78.3

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
93.30 TO 108.30	DACITE FLOW BRECCIA «DAC FLBX»	Colour: lt. green and white Grain Size: f.gr and m.gr. 93.3-94.45 -chlorite alt'd fine ash tuff as seen 48.2-52.7 Mottled appearance up to 15 cm strongly feldspar porphyritic zones possibly representing a crystal rich matrix -some more siliceous feldspar phyric zones possibly fragments -siliceous zones have vague, nebulous boundaries lower ctc fairly sharp @ 45-50 deg		-nil -occasional anhydrite veinlets seen to increase in size and abundance down-hole	-nil	Appearance of ash tuff on either side of dike suggests dikes may be dilating stratigraphy 96.3 -mercury mineral in veinlets?
108.30 TO 121.65	DACITE FLOW «DAC FLOW»	Colour: light green Grain Size -massive -chlorite flecks, after hornblende -feldspar phyric, feldspar vague -pitted surface similar to the dikes -lapilli tuff at lower ctc		-nil -anhydrite veinlets	-tr py	May be a dike however contacts appear conformable, no xenoliths 36413 111.6-114.6
121.65 TO 132.65	DACITE FLOW BRECCIA «DAC FLBX»	Colour: lt. green and white Grain Size: f.g and m.gr. Mottled, distinctly feldspar phyric zones as well as siliceous zones where feldspar phenocrysts are vague 130.4-131.2 -dacite lapilli tuff -fragment supported, subangular frags -heterolithic but mostly felsic type lithics ┤132.4-132.65├ «CHT» -disrupted chert at base @	 45	Nil -occasional anhydrite veinlets	Nil ┤132.4-132.65├ «tr cp» -chalcopyrite disseminations and anhydrite clots	 -possible horizon
132.65 TO 146.40	DACITE FLOW (?) «DAC FL»	Colour: light green Grain Size: f.gr. and m.gr. -massive, homogeneous v.f.gr. matrix -feldspar phyric, feldspars vague in places -chloritic flecks - possibly replacing hornblendes		-nil -contains occasional anhydrite veinlets	-nil	Identical to 108.3-121.65 -contacts appear conformable

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		-pitted appearance				-no xenoliths 36414 139.0-142.0
146.40 TO 150.47	DACITE CRYSTAL LAPILLI TUFF «DAC XT/LT»	Colour: lt. green and white Grain Size: m.gr. -feldspar phyric, occasional -crystal rich, crowded -weak fabric -lapilli are felsic lithics which are also felsic lithics -seems to contain large clasts of underlying flow near lower contact -lower contact irregular but appears conformable		-nil -anhydrite veins	-nil	
150.47 TO 168.90	DACITE FLOW «DAC FL»	Colour: light green Grain Size: f.gr. -contains xenolith or inclusion near upper contact -pitted appearance -massive -faintly feldspar phyric in some place but usually clearly feld phyric -some chlorite phenos after hole -some zones have very fine vesicles filled with epidote -numerous criss crossing narrow veinlets of gypsum -lower contact irregular but appears conformable		Very weak epidote attacking mafic phenocrysts	Nil	Resembles dikes but finer grain, but xenoliths, no chill margins
168.90 TO 176.05	DACITE LAPILLI/XTL AND ASH TUFF «DAC LT/XT ASH»	Colour: light green Grain Size: f.gr. to m.gr. .5 to 1 meter alternating beds of fragment rich dacite lithic lapilli tuffs, feldspar phyric crystal tuffs, and ultra-fine homogeneous massive ash beds or blocks; ashes are cherty upper ctc @ LT mostly felsic lithics, poorly sorted, sub-rounded	80	nil	nil	36415 169.8-172.8

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
176.05 TO 183.18	ANDESITE FLOW? «AND FL»	Colour: dark green Grain Size: f.gr. Contact sharp with overlying ash @ -massive -amygdaloidal zones 181.45-181.6 -lower contact indistinct	80	Moderate epidote chlorite filled amygdules anhydrite veins and veinlets up to 1 cm width, clear - translucent	Nil	Possible Dike
183.18 TO 184.80	DACITE LAP TUFF «DAC LT»	Colour: green and light green Grain Size; m.gr. -densely packed -heterolithic, poor to well sorted, subrounded -fragments mainly dacitic flow and massive ash clasts		-nil	-pyrite clasts less than 3 mm in size fine grained brassy colour	-are they filling crevices or possible tectonic breccia?
184.80 TO 187.40	ANDESITE FLOW «AND FL»	Colour: dark green Grain Size: f.gr. Upper ctc runs along core axis and massive -amygdaloidal -amygdules filled wtih chlorite < 1 mm	10	-wk. to moderate epidote appears to attack chlorite fill amygdules	-nil	-possible dike
187.40 TO 192.00	DACITE LAP TUFF AND ASH «DAC LT/ASH »	Colour: light green Grain Size: f.gr. Heterolithic lapilli tuff as previously described followed by crystal tuffs and as massive ash bed again more LT near base		Nil	Nil	
192.00 TO 205.27	INTERMED. FELDSPAR PORPH. DIKE «IFPD»	Colour: dark brown with pink spots Grain Size: f. and m.gr. Curious amoeboid shaped features along contacts -contains xenoliths -pink feldspar porphyritic -phenocrysts present only 2 meters away from margin; matrix appears muddy		Nil	Nil	Yet another variety of dike 36416 199.3-202.3
205.27 TO 218.00	DACITE LAP TUFF AND ASH «DAC LT/ASH »	Colour: Grain Size: Fragment supported lapilli tuff, - heterolithic dominated by dome fragments; subrounded to sub-		Nil	«tr py» Rare pyrite clasts in LT	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		angular contains occasional chloritic fragment 206.2-210.52 -ultra fine ash beds - bedding at @ thin bedded -largest fragment are subrounded feldspar phyric dacite flow clasts to 6 cm	80	ǂ216.07-216.7ǂ «i chlor» -intense chlorite	-traces of ultra fine pyrite in ash beds ǂ216.6-216.7ǂ «Py clsts» -pyrite clasts -appears to form fine grained disseminations in siliceous clasts -appear like sulphide frags but not massive -clasts are rounded and 10-20 cm in size	36080 216.5-216.82 -trace only
218.00 TO 251.90	DACITE FLOW «DAC FL»	Colour: green and white Grain Size: f.g and m.gr. -massive, flow banded dacite flow complex -flow banded in variety of angles to c.a. -feldspar phyric -matrix silicification in places 231.85-232.35 DAC LT -lapilli tuffs have contacts nearly parallel to c.a., possibly filling crevices of flow contact strongly deformed, muddy pyrite over 10 cm	55	-wk silica, wk-moderate to matrix silicification; anhydrite veining common; in places they appear stope wall rock	-nil -below 240.8 traces of ultrafine py ǂ251.9ǂ «Py» -semimassive pyrite over 10 cm as deformed zone	ǂ231.55-240.8ǂ «ANH VNS» -spectacular anhydrite veins wandering through pile 36417 239.9-242.9
251.90 TO 291.30	FELDSPAR PORPHRY DIKE «FHPD»	Colour: light green Grain Size: f. and m.gr. -somewhat ghostly feldspar phenocrysts and mafic (chlorite) phenocrysts set in a homogeneous f.gr. matrix -abundant black patches, possibly represent phenocrysts 256.92 -5-10 cm gouge, lower contact 10 cm gouge		-nil -anhydrite veinlets continue to be as intense as overlying flow	252.25-252.4 -pyrite, 5-7% in siliceous band at 45 deg to c.a.	36418 216.2-264.2

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		ǂ276.55-283.9ǂ «FPD» -upper contact @ -strongly feldspar porphyritic away from margins -2 metre homogeneous fine grained margin	30			
291.30 TO 327.00	ANDESITE FLOW/FLOW BRECCIA «AND FLBX»	Colour: dark green Grain Size: f. and m.gr. Upper ctc fault contact -mafic flow fragments frothy appearance densely packed -fragment supported flbx also massive amygdaloidal zones -below 308 rare felsic clasts with felsic clasts common toward base of unit -amygdules infilled with epidote and occasionally pyrite 312.6-312.9 -heterolithic lapilli tuff screen		«wk. chl» Weak chlorite -weak to moderate epidote usually as vein selvage	tr-1% py	36419 291.7-294.7
327.00 TO 332.40	FELDSPAR PORPHYRY DIKE «FPD»	Colour: light green Grain Size: f. to m.gr. ǂ327.0-327.5ǂ «ANH» -massive anhydrite vein Feldspar porphyritic -massive -chlorite flecks probably replacing early hornblendes		Anhydrite veins and veinlets	ǂ327.0-327.5ǂ «ANH VN»	
332.40 TO 336.20	ANDESITE FLOW «AND FLOW»	Colour: dark green Grain Size: f. to m.gr. Andesite flow and flow fragments -vesicular -as described 291.3 m to 327.0		Weak chlorite, anhydrite veinlets	-tr-1% py	36420 322.2-325.2
336.20 TO 340.46	DACITE FLOW «DAC FLOW»	Colour: Grain Size: -massive -siliceous -vague mafic phenocrysts		-anhydrite veinlets	-nil	-possible dike

0.00 TO 28.04	CASING					originally cased to 18.3 m then advanced
28.04 TO 211.00	FELDSPAR PORPHYRY DIKE «FHPD»	Colour: lt. green Grain Size: m.gr. -massive -feldspar porphyritic -weakly quartz phyric, occasional dark patch (hornblende?) -numerous fractures and veins and veinlets of dolomite -dolomite forms massive veins in places (57.0 m) -feldspars randomly distributed, subhedral to euhedral 1-2 mm -phenocryst rich zones		-nil	-nil	No mafic xenoliths observed 46.1-49.1: 11263 blocky ground
		{74.1-77.11} «MD» -massive dark green unit with dolomite and hem. veinlets				
		58.6 -shear zone, 2 cm gouge				
		64.45 -shear zone at, 3 cm gouge	20			
		{80.05-86.0} «SHR ZONE» -zone of deformation and gouge; numerous dolomite veinlets folded	27			Badly shattered
		{89.05-90.05} «ASH» -massive, homogeneous, fine grain, ash (?)			89.05-90.05 -2-3% py in ash bed	
		90.05-101.5 -massive, green, faintly feldspar porphyritic, numerous dolomite veinlets				91.44-94.4: 11264
		{101.5-102.5} «FLT» -shearing and gouge down core axis	10			
		102.5 -resume massive feldspar porphyry dike, fresh, feldspar rich			{115.8-121.3} «Qtz Py Vns» -coarse grained	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
					-pyrite occurs in occasional quartz veins and veinlets	
						Narrow (up to 5 cm) gouge zones frequent throughout unit
		117.6 -<10 cm wide quartz vein carrying 20% pyrite				
		119.0 -Quartz vein carrying 2-3% pyrite				
		⊣120.6-121.3⊢ «QTZ Vn» 2-3% pyrite	10			
		133.7 -2-3 cm quartz vein with 5% py				
		138.7 -shear, 5-10 cm gogue at	30			156.7-159.7: 11265
		166.1-170.1 -Mafic dike? -py 1-3%, locally 5%, numerous mafic patches, brecciated zones (168.7)				
		-resume main unit -feldspar porphyry with occasional quartz eye				
		⊣188.1⊢ «FLT» -10 cm gouge zone				
		⊣186.8-194.8⊢ «QPD» -abundant quartz eyes, some as large as 7 mm, contacts gradational with f.p. unit, quartz rich phase				
		⊣201.3⊢ «FLT» -gouge zone 5 mm	40			
		⊣201.75-203.0⊢ «AND LT» -mafic lapilli tuff or dike (?)		201.75-203.0 -strong chlorite alteration		
		205.05-211.0 -several shear zones in blocky, shattered ground, shears are gouge filled and range 20 to 50 deg.				
		Lower ctc marked by shear				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
211.00 TO 226.00	ANDESITE BLOCK & LAPILLI TUFF «AND BLT»	Colour: green and yellow Grain Size: m.gr. and f.gr. -heterolithic, poorly sorted -large, up to 10 cm epidotized clasts - probably felsic blocks -lapilli, mostly subangular felsics -matrix supported -matrix andesitic -broken hematitic zone near contact		«stg epi» -strong epidote alteration forming patches and vein selvedges	«tr cp» -tr py 211.8-213.4 -10-15% py, tr cp, associated with chloritic zone and fault gouge	 Similar to BLT, seen in S-91-05 218.2-221.2: 11266
226.00 TO 252.60	ANDESITE FLOW, FLOW BRECCIA «AND FLBX»	Colour: dark green and yellow Grain Size: f.gr. -contact not clear -frothy mafic clasts with chlorite filled vesicles -monolithic -magnetite occurs as veinlets and in anhydrite veinlets 235.75-238 -anhydrite forms pseudobreccia -densely packed		«stg. epi» -strong epidote	╟235.3-235.8╢ «tr sph» 242.3 -sphalerite and chalcopyrite filled vesicles 237.8-238.0 -1% cp as disseminatians and vein	«ANH» 244.8-247.8: 11267 -1% magnetite
252.60 TO 312.60	DACITE FLOW «DAC FLOW»	Colour: lt. green Grain Size: f.gr. -irregular contact -massive, vague feldspar phenocrysts -pseudo breccia formed by matrix silicification -abundant anhydrite veining - usually barren, forms a weakly developed stockwork -quartz veins often carry pyrite 259-259.5 -sheared and broken zone -2-3% pyrite 276.75-277.50 -andesite dyke of lapilli tuff screen		-Nil -anhydrite veins and veinlets -silicification probably due to proximity to dike 285.6-286.0 -hematitic chert invades flow or possible flow breccia fragments	«1% py» -trace - 1% disseminated pyrite -local concentrations 5% -pyrite in quartz veins	«ANH» -anhydrite veins up to 5 cm wide 273.4-276.4: 11268 300.8-303.8: 11269

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		277.65 -shear 2 cm gouge 278.0 -shear 2 cm gouge Appears to be brecciated toward base Faint mafic phenocrysts and mafic patches recognized in lower part of unit contact sharp at	 30			possible altered dike?
312.60 TO 333.50	FELDSPAR PORPHYRY DIKE «FQPD»	Colour: grey-green Grain Size: c.gr. -massive, fresh feldspars are subhedral to euhedral -chaotic arrangement -occasional quartz eye up to 5 mm and vague -phenocryst rich and coarser grained variety		-nil	-trace pyrite	-no xenoliths

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 24.38	CASING					
24.38 TO 48.90	ANDESITE DACITE LAP & XTL TUFF «DAC LT-XT»	Colour: green and white Grain Size; f.gr. -lapilli size felsic clasts and feldspar crystals -fragments are vague and ghostly -matrix is andesitic ash size material -rare mafic fragment 44.4 -shear 2-3 cm gouge		-Nil	-trace pyrite	-correlates with AND-DAC BLT in top of S-18 36.90-39.90: 11270
48.90 TO 53.45	FELDSPAR PORPHYRY DIKE «FPD»	Colour: light grey green Grain Size: f.gr and m.gr. -contact sharp at -massive -feldspars up to 2 mm -random distribution -pitted surface -some phenocrysts, vague	80	-nil	-nil	-no xenoliths -no mafic phenocrysts
53.45 TO 65.60	ANDESITE FLOW «AND FLOW»	Colour: Grain Size: Contact sharp @ -massive -amygdaloidal -amygdules chlorite filled - range up to 7 mm in size -some have irregular, almost hour glass shapes	«m. epi» 80 -moderate epidote -epidote patches -epidote veins and vein selvedges up to 10 cm in size -weak chlorite	-trace - 1% pyrite	57.0-60.0: 11271
65.60 TO 73.00	DACITE CRYSTAL TUFF «DAC XT»	Colour: Grain Size: -contact lost -feldspar phyric -crowded -crystals usually 1-2 mm in size -chloritic matrix in some places -appears to have preferred orientation at top		-nil	-nil	-part of the underlying unit -possible flow top

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		(welding or compaction?) -base contains massive feldspar porphyritic dome fragments -fragments boundaries are difficult to discern -lower ctc gradational				-flow top breccia at base
73.00 TO 105.40	DACITE FLOW «DAC FL»	Colour: light green Grain Size: f.gr. -feldspar porphyritic -massive zones and feldspar porphyritic rich zone -crystal rich zones appear to form a matrix for fsp, porphyritic frags similar to base of overlying unit 73-79.55 -very massive, possibly large blocks		-nil	-nil -trace - 15 py locally	88.8-91.8: 11272
105.40 TO 126.00	ANDESITE FLOW «AND FL»	Colour: dark green Grain Size: f.gr. contact sharp @ -massive -amygdaloidal -chlorite-filled amygdules -faintly feldspar porphyritic -amygdules are not frequent	70	«m. epi» -weak to moderate epidote as patches 4 cm and as vein selvedges	111.95 -pyrite clot 2 x 3cm Deep water?	118-121.0: 11273
126.00 TO 130.76	DACITE FLOW ? FPD «DAC FL?»	Colour: lt. white-green Grain Size; f.gr. and m.gr. -very massive -feldspar porphyritic -random distribution of fspars 129.5-130.12 -silicified andesite flow		-nil	«tr py» -trace pyrite	No mafic xenoliths, possible dyke or Dac flow block in andesite flow
130.76 TO 143.00	ANDESITE FLOW «AND FLOW»	Colour: dark green Grain Size: f.gr. -massive -rare amygdules -chlorite filled amygdules usually small 1 mm		-chlorite	«<1% py» -as disseminations, amygdule fill and vein control	140.8-143.8: 11274

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		in size -sulphide (py) fills amygdules at top			136.30 -minor veinlet carrying chalcopyrite and galena	
143.00 TO 146.30	FELDSPAR PORPHYRY DIKE «FQPD»	Colour: light green, speckled Grain Size: m.gr. -massive, feldspar porphyritic -quartz eyes to 5 mm size -crystals are subhedral and vague ┤143.85├ «FLT» -1 m of sand gouge		-nil	-trace pyrite on foliation planes	-no mafic xenoliths possible flow block?
146.30 TO 168.65	DACITE ASH «ASH»	Colour: khaki green Grain Size: ultra fine grained -massive, well preserved -homogeneous -some crystal rich flow fragments at top of unit -develops thin pyritic laminae lower in unit -beddings range 50-70 deg. -flame structures in coarser ash adn pyrite rich laminae indicate tops uphole 154.5-160.75 -Andesite ash -fine grained, dark green, massive, homogeneous 159.1-160.60 -silicified ash and crystal tuff 162.6-163.3 -sulphide mud v.f.gr. pyrite lower ctc appears conformable		154.5-160.75 -moderate epidote as 1-2 cm patches	1-2% pyrite as thin laminae towards base (ultra fine) 149.65-151.50 -fine grained massive pyrite on foliation plane ┤167.8├ «Py lam» -pyritic laminae 2-3 cm wide -trace chalcopyrite associated with elliptical siliceous clasts immediately above 163.5 -2-3% py, siliceous bands carry medium grained pyrite	Synvolcanic fault offsets frequent in pyritic laminae (concretions or accretionary lapilli) 16.4-166.4: 11275
168.65 TO 179.57	FELDSPAR PORPHYRY DIKE «FPD»	Colour; lt. green Grain Size; f.gr. -massive feldspar porphyritic -mafic xenoliths near upper contact			-trace pyrite	«ANH» -anhydrite veins

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		-anhydrite veinlets common up to 2 cm wide -lower contact also appears conformable	 80			-possible flow
179.57 TO 183.75	DACITE ASH AND CRYSTAL TUFF «ASH/XT»	Colour: green Grain Size: ultra f.gr. to f.gr. -thin to thick bedded homogeneous ashes -interbedded with thin beds of feldspar crystal tuffs	 75	-Nil -silicification near base -anhydrite veins	-trace pyrite -py laminae at 183.0	-Alternating thin beds of crystal tuff and ash; reminiscent of Seneca hanging-wall sediments
183.75 TO 209.00	FELDSPAR PORPHYRY DIKE «FD»	Colour: grey with pink crystals Grain Size: f. and m.gr. -massive feldspar porphyritic -matrix dominates -feldspars are pinkish and usually euhedral up to 5 mm size 189.72 -fault and ground core		-nil -dolomite veining common	-nil	-post mineralization as seen: S-91-12: 69-86 m 206.0 -amygdaloidal
209.00 TO 216.70	FELDSPAR PORPHYRY DIKE(?) «FPD?»	Colour: light green Grain Size: f.gr. -massive, feldspar porphyritic -mafic xenoliths common as dark green patches, up to 1 cm -seems to grade in and out of more dacite flow looking material eg 216.5-218.0		-frequent anhydrite veining -siliceous zone	-trace pyrite	«ANH» As seen 168.7-179.6 -and near sulphide zones in S-16, S-10 -possible sill 11276: 212-215
216.70 TO 249.70	DACITE FLOW «DAC FL»	Colour: lt. green to whitish green, mottled Grain Size: f.gr. -contact sheared at -massive QFP dome -quartz porphyritic -qtz eyes usually less than 1 mm -feldspar porphyritic -feldspars vague -phenocrysts usually subhedral	 55	«m. si» -silicification weakly developed anhydrite and pyrite pseudobreccia of stockwork type veining	«2% py» -as an ultrafine pseudobreccia and ultrafine - almost colloform pyrite stringers eg. 222.65	«wk anh-py stkwk» -Fleetwood Dome vaguely quartz phyric. 220.1-223.1: 11277 244-247: 11278

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		-flecks of white quartz-sericite mineral on core (leucoxene?)				
249.70 TO 273.47	FELSIC DIKE «FD»	Colour: very light brown Grain Size: ultra f.gr. ctc sharp at .6 m chill margin -extremely massive -weakly porphyritic -homogeneous except for occasional phenocryst - quartz or feldspar?, subhedral 1-2 mm -occasional dolomite vein (pinkish) -chilled margin -contact sharp	55 45	-Nil	-Nil	As seen S-91-10: 0-100 m 262-265: 11279
273.47 TO 355.32	DACITE FLOW «DAC FL»	Colour: very light green mottled Grain Size: f.gr. -massive QFP dome -quartz and feldspar porphyritic -phenocrysts vague and difficult to see -pseudobreccia of quartz, anhydrite and fine sulphide veins form a weak stockwork ┤273.45-278.07├ «DAC LT» -dacite blocks and heterolithic lapilli tuff, LT possibly filling fissures developed in flow? felsic clasts dominate ┤278.07-285.45├ «FHPD» -mafic xenolith rich QFP dike, anhydrite veinlets but no sulphides in veins ┤352.7├ «FLT» -30 cm gouge -resume sphalerite bearing unit below fault		-bleached looking selvedges around individual stockwork veinlets -weak silicification	«┤273.45-278.07├ «tr sph, cp» -siliceous lapilli contain traces of chalcopyrite and sphalerite ┤285.45-355.32├ «tr sph/cp» 300.3-300.6 -quartz-pyrite stringer; 2-3% py ┤307-355.32├ «2% py» «qtz-sph cp vns» -quartz veins carrying 1-2% sphalerite and chalcopyrite, sph is usually brown with purplish margins	«ANH» As seen 216.70-249.70 285.6-288.6: 11280 306.9-309.9: 11281 317.25-318.25: 36210 328.3-331.3: 11282

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
					Unit contains 1-2% ultra fine disseminated pyrite	349.1-352.1: 11283 terminated in mineralized rock Hole should be extended to test Mafic contact
	E.O.H.
