Suicide Creek

EXTRACT FROM MORRISON'S LETTER DATED MAY 30th, 1960

Hematite

Suicide Creek Hematite: May 30 1960 15

Frank Buker, and his brother have found a specular hematite exposure at the head of Suicide Creek about 10 miles from the valley floor of the Fraser. Assays of specimens show 58% Fe. The material is very fine grained. The Bukers say they have two main showings about two thousand feet apart. Like all optimistic prospectors, they figure the area between, is all underlain by hematite. Plan to make a one-day trip and sample and examine this one, next weekend. Access can only be had over the private logging roads on weekends.

Assessment:

The suicide Creek hematite deposit will be examined this week; Morrison barite is at the 5500 ft. level, still snow-covered and will depend on further samples being forwarded for examination.

EXTRACT FROM ROD MACRAE'S LETTER DATED MAY 30th, 1960

Suicide Creek Hematite: 49-45; 122-15

Frank Buker, and his brother have found a specular hematite exposure at the head of Suicide Creek about 10 miles from the valley floor of the Fraser. Assays of specimens show 58% Fe.
