Exploration Manager
Corporation Falconbridge Copper
Vancouver, B.C.

Dear Sir,

I have enclosed maps and other data on two mining properties that I have staked in the Eagle Bay Formation in southern B.C.

These properties are available for option if you should so desire.

My telephone number in Kelowna is 764-7440.

Yours truly

Paul A. Ziebart

LOOKOUT CLAIM

82M/12E

The Lookout property consists of 9 units staked by myself in June of this year. The claim is located 4 miles south of the village of Vavenby which is located on Hwy. #5. Access is by 13 kilometers of good logging road from Vavenby.

The claims are underlain by rocks of the Eagle Bay Fm., and locally include a massive Limestone in contact with green chlorite schists and sericite chlorite schists. The schistose sequence includes a quartz-eye sericite unit. Some of these schists contain disseminated pyrite.

I staked the lookout claim on the basis of several anomalous soil samples. I took these samples to test a color anomaly in the soil exposed in a road cut. The soil here has a striking brown, rusty colour. Two more lines further up-slope were run and confirmed the anomalous values on the lower line. A proper soil grid is beyond my personal resources consequently, I am offering this property to any mining

(cont.)

company interested in raw prospects.
I have spent a very limited amount of time on this property which has very little outcrop exposure. My work has consisted entirely of soil sampling and the staking of the claim.

In the last 7 years I have spent a considerable time working in the Eagle Bay Formation and I am quite confident that the source of the soil anomaly is massive sulfide mineralization. Seven years ago while working for Esso Minerals I made a similar discovery 3.5 kilometers west of the Lookout claim. The geological setting was much the same and the mineralization consisted of massive sphalerite and galena with copper and silver values.

I am quite confident that there is similar mineralization on the Lookout property.

Soil Log FG

MS Property

82M/5E
Kamloops M.D.

The MS property consists of 4 two-post claims staked by me on May 31, 1984. These claims are located at the headwaters of Fenell and Gollen Creeks at \approx 4500' elevation. Access is by road from Barriere, 23 miles.

As far as I know the earliest work done on this property was undertaken by Dynasty Exploration Limited in 1971. This work consisted of geological mapping, soil sampling and a magnetometer survey. In 1975 J.A. Fennel drilled two X-Ray holes totaling 76.5 meters in length.

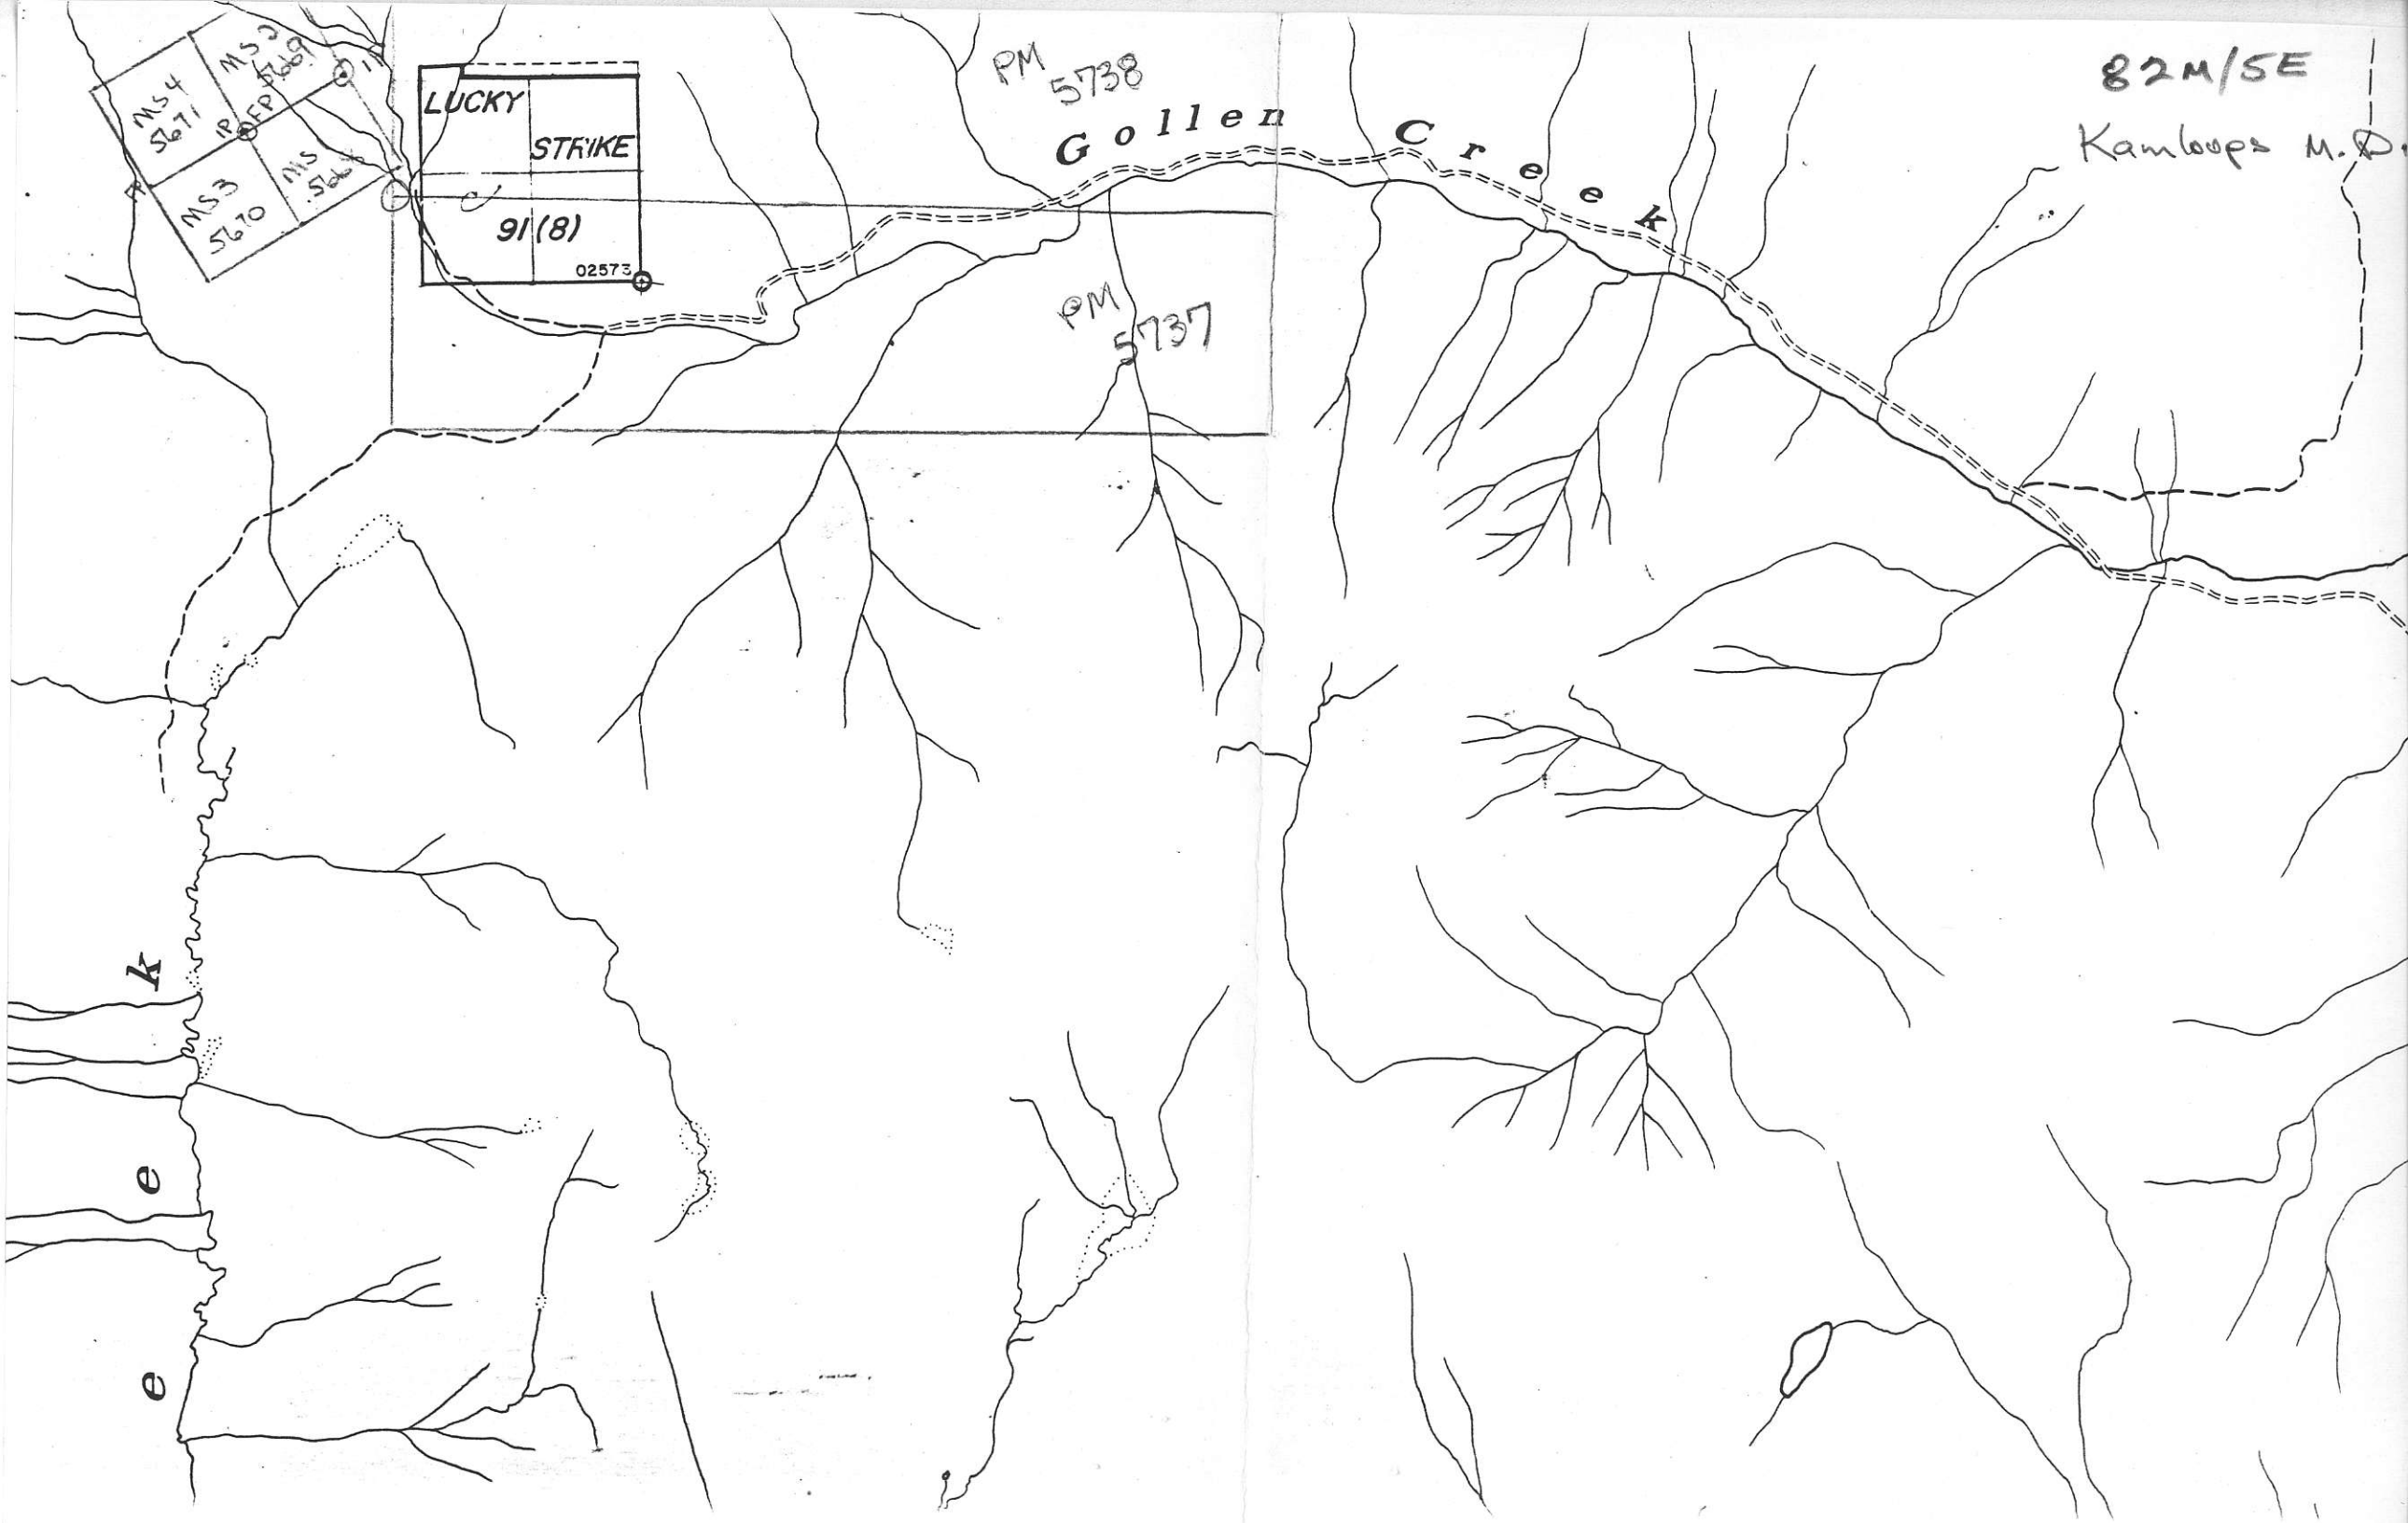

The MS claims are underlain by a chlorite schist-greenstone unit in contact with a limestone unit. Seven copper showings are found in this unit along a strike length of 2500 feet. These copper showings are located within an envelope of silicification, pyritization and potassium feldspar alteration (A.R. 3430). This alteration is confined to the chlorite schist-greenstone unit.

While the sampling of these showings by Dynasty averaged only 0.43% (cent.)

Cu, it is interesting to note that there is no record of any samples run for gold. It is also interesting to note that there has never been a E.M. survey done to test for massive sulfide conductors.

The large alteration zone and the fact that this property has never been looked at as a massive sulfide bet, makes it an interesting prospect.
