

MONTH END REPORT  
AUGUST 1989

824105

RICHTER PROPERTY

The Testalinden grid overlying the quartz veins and related gossan was completed in early August. Follow-up detailed (1:2500) grid mapping along with a soils program has since been completed. A total of 495 soil samples were taken @ 25m intervals. Results are pending. The mapping revealed the presence of more quartz veins, one up to 10m wide, with associated gossan. A number of gossans were panel sampled. Their analysis returned a significant number of anomalous Au values, although nothing in the range of 6800 ppb Au grab sample taken previously. The area has proven to be highly faulted and in large part hosted by altered, silicified and sheared granodiorite. VLF geophysics is just beginning on the grid. Blasting will begin shortly on some of the gossanous areas.

A rece soils program is being continued over the major drainages on the property. Also, two more grids are in the planning stages for two other areas of interest on the property.

FERROUX PROPERTY

The assessment report has been written and filed for the WT claims. Trenching will soon be underway to expose the mineralized quartz monzonite.

LOAK PROPERTY

The assessment report has been written and filed for the Loak property. Two years of assessment has been completed and recorded.
