

SCOTCH

The SCOTCH property is a polymetallic massive sulphide prospect in the Adams Lake region northeast of Kamloops, B.C. In the past, airborne and ground geophysical surveys have delineated several electromagnetic conductors along a contact zone between volcanic and sedimentary rocks. Some of these conductors have coincident magnetic and gravity anomalies, suggesting the presence of massive sulphide deposits.

Diamond drilling on one of the geophysical conductors in previous years intersected both massive and dispersed sulphide mineralization. Soil sampling has defined several strong lead, zinc and copper anomalies along the favourable contact zone.

In recent weeks, Minnova Inc. has announced the discovery of high-grade silver ore in a massive sulphide deposit on the Rea Gold property west of Adams Lake. This discovery is a short distance from the original Rea Gold gold discovery, and is on a contact between volcanic and sedimentary rocks similar to that on the SCOTCH property.

Brican plans to test the geophysical targets defined by the 1986 work with a 1987 program of backhoe trenching followed by drilling where warranted. Also, a strong lead anomaly in soils will be explored in detail for precious metal bearing massive sulphide mineralization.

The SCOTCH property is 100% owned by Brican.
