SUMMARY

During 1981, under the direction of Mr. D. Sumners, a prospecting program was conducted on the Sugarloaf claims on Tsalkom Mountain near Adams Lake, B.C. The area was selected as the result of the recommendation of Mr. F. Markin who had recalled uncovering several mineralized quartz veins while constructing logging roads in the area some ten years earlier.

In October of the same year, a crew from Hinterland Resource Services Ltd. conducted a geochemical survey over the old Sugarloaf claims. While the geochemical survey was in progress, a trenching program under the direction of Messrs. D. Sumners and F. Markin uncovered several mineralized quartz veins carrying values in silver and molybdenum with minor values in lead and zinc. The widths of the vein varied from 0.5 to 2.0 m and averaged less than 1 metre.

Due to economic conditions in 1982 no further work was done on the property as no funds were available to continue the program commenced in October 1981. The geochemical survey and the physical work (trenching)

completed on the property was not recorded as assessment and the claims lapsed. The claims were restaked in December, 1982 (Rec. Nos. 4293 to 4303 incl.) and cover essentially the same ground covered by the old Sugarloaf claims. In addition, the Arm 1 to 4 mineral claims (Rec Nos. 4508 to 4511) were staked surrounding the Sugarloaf two-post claims.

Further work is recommended for the property to test for the extension of the vein trend to the southwest of the grid area (Oct. 81). The possibility of finding better grades of mineralization along strike and at depth warrants a phased program of exploration totalling about \$250,000 over two years. At this point a test of merit would be required to determine the advisability of proceeding to a full feasibility study. An interim report would be required at the end of the third phase outlined in the report.

INTRODUCTION

At the request of Mr. D. Sumners, president of Markin Resources Ltd., the author prepared this report to initiate an exploration program to determine the possibility of uncovering higher grade, more consistent mineralization

VLH CONSULTANTS LTD.

in several mineralized quartz veins cutting across the Sugarloaf claims. The author has examined the property and supervised the geochemical survey in 1981 on the old Sugarloaf claims. These claims lapsed and were subsequently re-staked (also called Sugarloaf). By examining the old claim affidavits it is relatively easy to correlate the workings on the old claims to the new Sugarloaf claims, as the same posts were used for the two sets of claims.

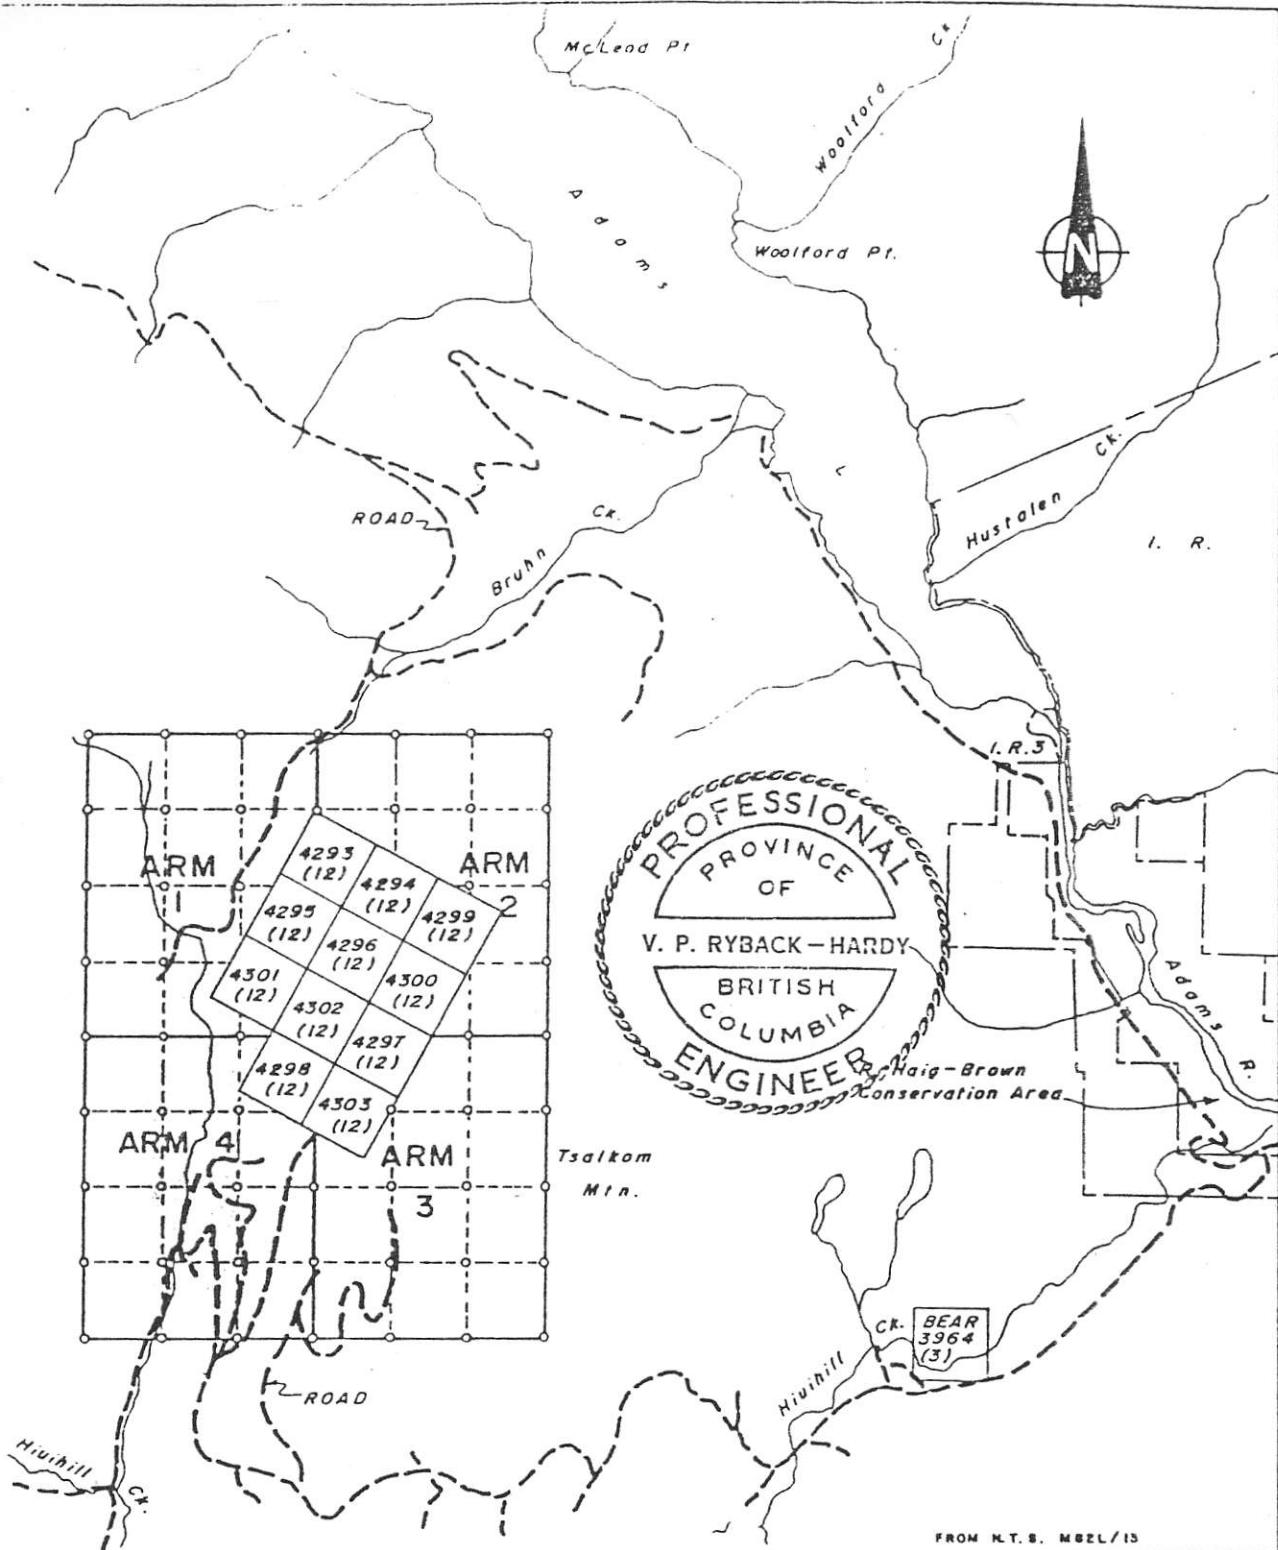

LOCATION AND ACCESS (119° 43' W, 50° 56' N)

The property is located in the Kamloops Mining Division and is shown on the Ministry of Energy Mines and Petroleum Resources mineral title reference map 82L/13E. The claims are more particularly located on the northwest slope of Tsalkom Mountain south of the headwaters of Bruhn Creek. Tsalkom Mountain is located 11 km due north of Chase B.C. Access to the property is by good gravel road commencing from the Adams Lake saw mill.

TOPOGRAPHY AND VEGETATION

The claims are located in the Shushwap Highlands and

BEMA INDUSTRIES LTD.

elevations vary from 1560 metres to about 1050 metres. Slopes are moderate and the area is relatively easy to work. Much of the area has been logged and second growth consists mainly of balsam, fir, spruce and yellow cedar.

PROPERTY DEFINITION

The property consists of eleven two-post claims (Rec. Nos. 4293 to 4303 inclusive) and the Arm 1 to 4 mineral claims (Rec. Nos. 4508 to 4511). The record date of the two-post claims is December 30, 1982, and the record date for the grid claims is June 14, 1983. The author has not seen the new location posts. However, the new Sugarloaf claims were re-staked using the old location posts and previous exploration work can be correlated to the new claims. The Arm claims were staked on behalf of Markin Resources Ltd. by Bema Industries Ltd., a reputable mining services contractor. All claims are owned outright by Markin Resources Ltd.

The old Sugarloaf claims correspond to the new Sugarloaf claims as follows:

Old claims

New Claims (Rec. No.)

Sugarloaf 43	4293
Sugarloaf 35	4294
Sugarloaf 34	4295
Sugarloaf 37	4296
Sugarloaf 31	4297
Sugarloaf 36	4298
Sugarloaf 44	4299
Sugarloaf 39	4300
Sugarloaf 41	4301
Sugarloaf 38	4302
Sugarloaf 40	4303

GEOLOGY

Regionally the area is underlain by schists, quartzite limestone and argillite of the proterozoic Shuswap Terrain of highly metamorphosed rocks. Locally, several quartz veins of varying widths cut greenstone and greenschist. The quartz veins are mineralized with galena, sphalerite, pyrite with some molybdenite. The quartz veins were mapped as shown on the attached plans.

It has been reported that a specimen sample

containing high grade sphalerite was recently found some distance to the southwest of 1981 grid area in what may be the extension of vein No. 3. This has not been verified by the author to date.

GEOCHEMISTRY

During October 1981 a grid consisting of approximately 11 line km of base line and cross lines were established on the property. Soil samples (231) were collected at 50 metre intervals along lines at 100 metre separations. The soils were collected using a mattock from the B horizon at an average depth of about 0.4 metres. The soils were analysed by the atomic absorption method. The rock samples were analysed using standard fire assay techniques.

The values were plotted at their respective sample sites and the results analysed. No statistical treatment of the values were done as a visual inspection showed an anomalous area to the southwest with a marked increase in geochemical zinc as the argillite sequence is approached. The high zinc in soil values may reflect the mineralization in vein No. 3 and indicates some continuity of the vein to

the southwest beyond the grid area.

CONCLUSIONS

The Sugarloaf claims cover an area containing several quartz veins carrying interesting values in silver, lead, zinc and molybdenum. At times, mineralization within the veins can be spectacularly high, although the mineralization is irregularly distributed. The soil geochemical results indicate that the vein mineralization responds poorly to geochemical prospecting. This may be due to the sample separation being too great for the narrow target being sought or that deep overburden may be masking heavy metal hydromorphic dispersion in the soils. A significant amount of information can be acquired by conducting a soil profile over an area of known mineralization and determining the optimum horizon to sample. It may be that a closer spacing of sample sites (25 metres rather than 50 metres) may better define the narrow vein mineralization.

Further exploration is recommended for the property to the southwest of the 1981 grid area to determine if the veins continue along strike and if the grade and continuity

of mineralization improves in the vein as the vein cuts through the argillites.

RECOMMENDATIONS

In order to test the continuity and grade of the vein system the following program is recommended:

- (1) Geochemical Survey - A soil profile should be conducted over an area of known mineralization to determine the optimum horizon for sampling.
- (2) Geophysical Survey - An EM Survey should be conducted over the claim area to test for the occurrence of conductors (highly mineralized quartz veins)
- (3) Geological mapping and sampling to trace and delineate the veins
- (4) Trenching - to aid the above
- (5) Drilling - to test the veins at depth

PROJECT COSTS

PHASE I

Geochemical Surveys (approximately 500 samples)	\$10,000
Geological Mapping	5,000
Geophysical Surveys	10,000
Trenching	10,000
Assays	5,000
Support Costs	5,000
Reports and Contingency	5,000
<hr/>	
Total	\$50,000

PHASE II

Trenching	\$10,000
Diamond Drilling 400 metres	50,000
Assays	5,000
Reports and Contingency	10,000
<hr/>	
Total	\$75,000

PHASE III

Diamond Drilling	1000 metres	\$125,000
------------------	-------------	-----------

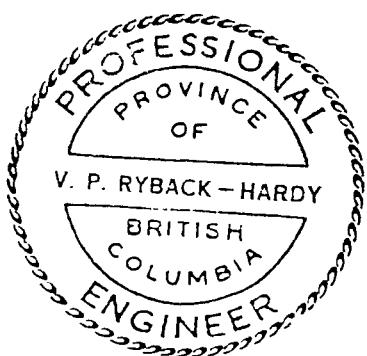

Each phase is contingent upon favourable results
encountered in the previous phase.

Respectfully submitted,

V. Ryback-Hardy

STATEMENT OF QUALIFICATIONS

I, VICTOR PETER RYBACK-HARDY of Richmond, British Columbia,
do hereby certify that:

1. I am a consulting Geological Engineer with offices at
403-750 W. Pender Street Vancouver, B. C., V6C 2T7.
2. I am a graduate of the University of British Columbia
with a degree (B.A.Sc.) in Geological Engineering (Option II
- Geophysics). I graduated in 1970.
3. I am a member of the Association of Professional
Engineers of British Columbia, Registration No. 8825 (1972).
I am also a commissioned British Columbia Land Surveyor,
Commission No. 580 (1979)
4. I have been practising my profession as a Geological
Engineer for 11 years.
5. I have no interest, nor do I expect to receive any
interest, direct or indirect, in the properties or
securities of Markin Resources Ltd.

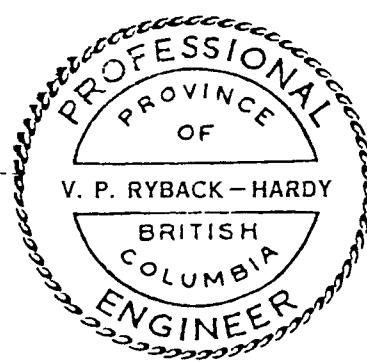

6. Markin Resources Ltd. is hereby given permission to reproduce this report, or any part of it, in a prospectus for financing purposes; provided, however, that no portion may be used out of context in such manner as to convey a meaning differing from that set out in the whole.

7. I examined the property in October 1981 while supervising the geochemical survey conducted by Hinterland Resource Services Ltd. The claims examined were allowed to lapse and were subsequently re-staked in Dec. 1982. To my knowledge, the present property consists of the same area with the addition of the new Arm claims. I have not examined the location posts of the new claims. To my knowledge, there has been no further assessment work performed on the claims since 1981. No guarantee of the boundaries of the claims can be given until such time as the claims are legally surveyed.

Dated at Vancouver, B. C. this 15th day of July, 1983.
