Re: ChuChua JV - Progress Report - July 1, 1991 - Sept. 30, 1991

Dear Sirs,

Drilling commenced on the ChuChua property in mid-

July and 7 holes totalling 3537.6 meters have been completed.

The highlight of the drilling was the intersection of a 22.45
meter wide (true width ≈ 9.5 m) massive sulphide zone in

hole CCF-69. This new zone occurs 70 meters west and

in the hanging wall of the ChuChua horizon. It is

hosted in unaltered mafic pillow basalts and both upper

and lower contacts are sharp. The sulphide zone consists

of 12.85 meters of massive pyrite, chalcopyrite, magnetite

and hematite, 7.7 meters of siliceous and chloritic fragments

(30-35%) Hosted in pyritic matrix and 1.9m of

(20-25%) of +. +. +. +. +.

Holes CCF67 and 68. Indicated that this ^{Subsidi}
unaltered mafic pillows. The upper 4.35 meters of massive
sulphides assayed 2.13% Cu and 8.4 g/t Ag. The up-dip
potential of this new zone is limited but the down-
dip and strike extent is virtually untested. Further
drilling is being planned.

The remaining ^{widely spaced} hole tested the Chu Chua
horizon at depth and along strike from the known deposit.
This drilling defined an extensive zone of intensive
silicification and pyrite-chalcopyrite stringer mineralization
to the north of the deposit. It appears that the Chu Chua
massive ^{sulphides} formed in a basin on the southern fringe of
this alteration. The ^{epithermal} exhalite associated with
the sulphide deposition has been traced down-dip for 750
meters and has a strike length of at least 500 meters.

sheet does not extend south of the original deposit but is restricted to an area that occurs vertically below the Main Lens.

Details and significant results of the drilling to date are summarized in the attached tables.

If there are any questions, give me a call.

yours sincerely
J.Z.

Copies to Quinterra
& Pacific Cassian.

- would like long section from ^{Sept} monthend drafted.
+ updated section (attached).

include monthend tables - July
Aug
Sept

+ add assays from CCF-69 to Sept table.

7.

To: Ian

From: Gary

Subject: Assays - hole CCF-69

381.2 - 396.05 - massive sulphides + siliceous frags
0.973% Cu, 5.4 g/t Ag over 14.85m

includes 381.2 - 385.55 - massive sulphides
2.126% Cu, 8.4 g/t Ag over 4.35m

396.05 - 397.95 - unaltered mafic pillows - assays not received yet.

397.95 - 403.65 - massive sulphides
0.75% Cu, 5.9 g/t Ag over 5.70m.

includes 403.05 - 403.65 - banded py-cp + mp's.
2.031% Cu, 10.7 g/t Ag over 0.6m

Table 1. Chu Chua Drilling - August, 1991

Hole #	Location	Collar Azimuth	Collar Dip	Final Depth	Results
CCF-64 (P-2)	106+15N; 98+56E	093	-60	346.25 m (201.15 in Aug)	160.6-188.7 185.6-188.7 5-15% py stringers 0.23% Cu over 3.1 m
CCF-65 (P-3)	108.00N; 98+50E	090	-69	427.3 m	CC horizon diked out - screen of silicified basalt
CCF-66	101+30N; 97+41E	090	-68	716.6 m	470.9-479.65 483.4-489.5 584.7-587.5 534.6-716.6 7-15% py as stringers 7-15% py as stringers 15% py stringers strong pervasive silicification
			3 holes	1345.05 m	
			YTD 4 holes	2019.25 m	
Previous Drilling Results					
CCF-63	387.5-399.2				0.12% Cu py-cp stringers
