GUPPY  
826496

To R. A. Dujardin From Tor Bruland

Subject Guppy Option Date April 22, 1988

Additional sampling of the Guppy showing identified the gold mineralization to be limited to isolated narrow quartz veins in the andesite. There is no indication of a gold bearing quartz vein stockwork in this showing. The gold mineralization in the quartz veins is spotty. A subeconomic grade in one 1m channel sample could not be duplicated by resampling the same interval. High gold values from individual veins get diluted to subeconomic grade when they are averaged over 1m. These subeconomic grades are spotty. No further work is warranted for this property.

My recommendation is that the property should be returned to Walter and Olive Guppy prior to May 1 to prevent payment of an additional \$500 on that date.

Proposed cut grid to cover areas of  
known quartz veining (▬) and probable  
extensions. (Total approx. 40 km.)
