MONTHLY REPORT - JULY 1985

Project B-02A, 92H/5

Sampling and mapping of the quartz diorite stock on the Bluechip property in Laidlaw. In addition to the 3 previous located adits, a fourth adit was located in the creek by the eastern contact of the quartz diorite.

Mapping of the stock located the eastern and western contact to the surrounding argillite. The northern and southern contact could not be located accurately due to the lack of outcrops. The quartz diorite could be in the order of 250 by 250m with a hornfels halo of 5-10m with secondary biotite along the contact to the argillite. In addition to the previously 55 samples 53 samples for a total of 108 samples. Sampling was done in quartz diorite in the slope above the 3 central adits and, in the creek along the eastern contact, in the Creek adit which extends into the hornfels and from the Western adit. The Western adit was originally flooded, but draining of the adit for about 2 weeks permitted us to get to within 10m of the end. After 2 weeks drainage of the adit the water level in the last 10m was in excess of 1.0m.

The majority of the samples were from quartz diorite with 3 samples of hornfels from the end of the Creek adit and some samples of barren quartz veins.

Assays from the 108 samples collected at the Bluechip property returned low Au & Ag values. Isolated high Au or Ag values were from pyrrhotite, quartz-pyrrhotite or quartz veins although not all of these veins returned Au & Ag values. There does not seem to be any relation between pyrrhotite content in the quartz veins and Au or Ag values. This ~~stock~~ quartz diorite stock do not have a potential for a deposit similar to ABO and no follow up work is recommended.

Project B-177, ABO 92H/5

The ~~aggs~~ agreement with ABO was sign in late June and work resumed on the property at June 29. All the unlogged core on the property ~~was~~ were moved down to the core shack, and the core in the racks were organised according to holes.
