KERR ADDISON MINES LIMITED

BIG BAR PROJECT

BIG BAR CREEK, B. C.

August 20, 1979

Exploration History

The Big Bar Claims were staked after discovery of anomalous values in gold during a June 1979 reconnaissance program.

Follow-up mapping and geochemical sampling has revealed anomalous geochemical values in the area of a weathered, brecciated rhyolite. Preliminary sampling results indicate that silica veined zones are anomalous in silver (2.6 - 4.8 ppm), lead (up to 163 ppm), gold (10 - 360 ppb) and arsenic (30 - 800 ppm).

The property held by Kerr Addison Mines Limited consists of two claims which comprise a total of 21 units.
